40% reduction in air consumption

Cuts air consumption by operating the return stroke at a reduced pressure.
Cuts air consumption by operating the return stroke at a reduced pressure.

Conventional valve

Working and return strokes operated at the same pressure

Air saving valve

Return stroke operated at a reduced pressure

Pressure valve

Regulator with check valve + Speed controller

Series ASR

Flow valve

Quick supply and exhaust valve + Speed controller (Meter-in, Meter-out)

Series ASQ
**Jerk prevention in vertical operation of the cylinder**

Balancing pressure

Pressure valve

Speed controller

**Quick air charge at the end of stroke for press applications**

Quick supply and exhaust valve

Flow valve

Pressure valve

Speed controller

**Other applications**

**Improved response time**

Operation delay in a return stroke is reduced by the use of a quick supply and exhaust valve.

**Easy piping**

The body and one-touch fitting allow 360° rotation. The sealant on the male thread is standardized.

The set pressure can be either fixed or variable.

**Series Variations**

Operating Principle

**Working Stroke**

1. The cylinder starts smoothly because jerks are prevented by meter-in control.

2. When the cylinder reaches the stroke end, the quick air charge by the flow valve rapidly increases the rear side pressure (PH) from A to B. If a speed controller is used instead of the flow valve, charging air will take more time as illustrated by line A-C, causing delay in the pressure rise.

**Return Stroke**

3. To prevent delay due to the pressure gap, air is rapidly exhausted to decrease the pressure from D to E, after which the piston moves at a constant speed. If a speed controller is used instead of the flow valve, exhausting air will take more time as illustrated by line D-F, resulting in longer stop time of the cylinder and a consequent time loss.

4. The cylinder operates at a low pressure required for a return.
Selection and Adjustment

Install a flow valve on the working side which requires the cylinder output and a pressure valve on the return side. The product cannot be used in cases where the same pressure is necessary for both working and return strokes. In such cases use a speed controller.

Horizontal mounting

Low pressure side: Pressure valve
High pressure side: Flow valve

Refer to Adjustment Procedure 1 for pressure and speed adjustment.

Vertical mounting

Low pressure side: Pressure valve
High pressure side: Flow valve

In case the load ratio is 50% or lower at the set pressure of the flow valve:

Refer to Adjustment Procedure 1 for pressure and speed adjustment.

If the load ratio at the set pressure of the flow valve exceeds 50%, install a dual speed controller (meter-in and meter-out control) on the high pressure side.

Low pressure side: Pressure valve
High pressure side: Dual speed controller

Refer to Adjustment Procedure 2 for pressure and speed adjustment.
Adjustment Procedure 1

Pressure Adjustment

1. The fixed set pressure type (-F20) does not require adjustment because the pressure is fixed at 0.2 MPa.
2. The set pressure of the variable set pressure type is adjusted with knob A and knob C respectively. Turn the knob clockwise to increase the pressure and counterclockwise to decrease the pressure.
3. The graduations 1, 2, and 3 correspond to 0.1, 0.2, and 0.3 MPa respectively. Align the bottom end of the knob with the graduated line for adjustment.
4. Set the same pressure for the pressure valve and the flow valve (0.2 MPa as the recommended value).
5. The inlet side should be supplied with a pressure which is higher than the set pressure by 0.1 MPa or more.
6. Cap the valve after adjustment.

Speed Control

1. The cylinder speed is adjusted with knobs C, D, and E. First have all the knobs fully closed and then open them gradually for adjustment. Turn the knob clockwise to close (decrease the speed of the piston rod) and counterclockwise to open (increase the speed of the piston rod).
2. Speed adjustment for the working stroke
   The speed is adjusted with the pressure valve and the flow valve.
   Open knobs C and E gradually until the required speed is achieved. Make sure that knobs C and D are opened by the same number of rotations.
   Note 1) If the piston rod jerks, close knob E until the smooth operation is achieved.
3. Speed adjustment for return stroke
   The speed is adjusted with the flow valve.
   Open knob D gradually until the required speed is achieved.
4. Be sure to tighten the lock nut after adjustment.

Pressure Valve: Series ASR

Flow Valve: Series ASQ

Adjustment Procedure 2

Pressure Adjustment

1. The fixed set pressure type (-F20) does not require adjustment because the pressure is fixed at 0.2 MPa.
2. The pressure at the low pressure side (return stroke side) is adjusted by the pressure valve.
3. The set pressure is adjusted with knob A. Turn the knob clockwise to increase the pressure and counterclockwise to decrease the pressure.
4. The graduations 1, 2, and 3 correspond to 0.1, 0.2, and 0.3 MPa respectively. Align the bottom end of the knob with the graduated line for adjustment.
5. Keep the set pressure as low as possible in order to achieve good air saving effect.
6. Cap the valve after adjustment.

Speed Control

1. The cylinder speed is adjusted with knobs C, D, and E. First have all the knobs fully closed and then open them gradually for adjustment. Turn the knob clockwise to close (decrease the speed of the piston rod) and counterclockwise to open (increase the speed of the piston rod).
2. Speed adjustment for the working stroke
   The speed is adjusted with the pressure valve and the dual speed controller.
   Open knobs C and E gradually until the required speed is achieved. Make sure that knobs C and D are opened by the same number of rotations.
   Note 1) If the piston rod jerks, close knob E until the smooth operation is achieved.
3. Speed adjustment for return stroke
   The speed is adjusted with the dual speed controller.
   Open knob F gradually until the required speed is achieved.
4. Be sure to tighten the lock nut after adjustment.

Note 1) “d” indicates the applicable tubing O.D.
Note 2) L5 is the dimension for the variable set pressure type.
Note 3) L6 is the dimension for the fixed set pressure type.
Note 4) A1 and A2 are reference dimensions after installation.
Note 5) *1 is the weight for the variable set pressure type and *2 is that for the fixed set pressure type.
### Selection

**Warning**

1. Confirm the specifications.
   - The products appearing in this catalog are designed for use only in compressed air (including vacuum pressure) systems.
   - Do not use outside the specified ranges of pressure, temperature, etc., as this may cause damage or malfunction. (Refer to specifications.)
   - Please consult with SMC if fluids other than compressed air (including vacuum pressure) are to be used.

### Installation

**Warning**

1. Read the instruction manual carefully.
   - The instruction manual should be carefully read and fully understood before the product is installed and operated. Also, the manual should be kept where it can be easily referred to at any time.
2. Allow space for maintenance.
   - Allow the space necessary for maintenance and inspections.
3. Tighten screws with the proper tightening torque.
   - When mounting the product, tighten screws with the recommended torque.

### Piping

**Caution**

1. Preparation before piping
   - Before piping is connected, it should be thoroughly blown out with air (flushing) or washed to remove chips, cutting oil and other debris from inside the pipe.
2. Wrapping of sealant tape
   - When screwing together pipes, fittings, etc., be certain that chips from the pipe threads and sealant material do not get inside the piping.
   - Further, when sealant tape is used, leave 1.5 to 2 thread ridges exposed at the end of the threads.

### Air Supply

**Warning**

1. Types of fluid
   - This product is designed for use with compressed air. Please contact SMC if a different type of fluid is to be used.
   - Please contact SMC regarding products for general fluids, to confirm which fluids can be used.
2. A large amount of condensate
   - Pressurized air containing a large amount of condensate may cause malfunction of the pneumatic equipment. An air dryer or water separator should be installed upstream from the filters.

**Caution**

3. Drain flushing management
   - If the air filter drains are not flushed regularly, the condensate will flow downstream from the drains, resulting in malfunction of the pneumatic equipment.
   - In cases where drain flushing will be difficult, use of filters with auto drain is recommended.
   - For detailed information on the quality of compressed air, refer to Best Pneumatics Vol. 14.

4. Types of air
   - Do not use compressed air containing chemicals, salt, corrosive gases, synthetic oil which includes organic solvents, etc., which may cause damage or faulty operation.

### Operating Environment

**Warning**

1. Do not use valves where there is direct contact with, or in atmospheres of, corrosive gases, chemicals, salt water, water or steam.
2. Provide shade in locations which receive direct sunlight.
3. Do not operate in locations where vibration or impact occurs.
4. Do not operate in locations where the product is exposed to direct heat radiation from a heat source at a close distance.

### Maintenance

**Warning**

1. Maintenance should be performed in accordance with the procedures in the instruction manual.
   - Incorrect handling can cause damage or malfunction of machinery and equipment, etc.
2. Maintenance work
   - Compressed air can be dangerous if handled improperly. Element replacement and other maintenance etc., should be performed by personnel having sufficient knowledge and experience pertaining to pneumatic equipment, while also adhering to the product specifications.
3. Drain flushing
   - Condensate should be flushed from the air filter and other drains on a regular basis.
4. Pre-maintenance checks
   - When the product is to be removed, be sure to shut off the supply pressure, release compressed air in the pipelines and confirm an atmospheric release condition before proceeding.
5. Post-maintenance checks
   - After mounting, repair or renovation, supply compressed air and perform suitable function and leak tests. If an audible leak is detected or equipment does not operate properly, stop operation and confirm that mounting is correct.
6. Disassembly and modification is prohibited.
   - Do not disassemble or modify the main unit.
Air Saving Valve
Specific Product Precautions
Be sure to read before handling.

Warning
1. The product cannot be used as a stop valve, of which zero leakage is required.
The specifications of the product allow a certain degree of leakage.
2. Confirm whether PTFE can be used.
The sealing compound contains PTFE (tetrafluoroethylene resin) powder. Make sure that it will not cause any problem in operation.
3. Keep the set pressure range of the outlet pressure of the pressure valve within 85% that of the inlet pressure.
   If the value exceeds 85%, the pressure may become unstable, affected by the fluctuation of the inlet pressure.

Installation
Warning
1. Confirm that the lock nut is not loose.
   If the lock nut is loose, there may be dangerous changes in actuator speed.
2. The number of opening and closing rotations of the needle valve and adjustment screw should be adjusted within the range of the specifications.
   Since it has a pull-out stop mechanism, it will not rotate past the limit. Confirm the number of rotations for the product being used, as excessive turning of the needle will cause damage.
3. To adjust the speed, start with the needle in the completely closed position, and then adjust by opening gradually.
   When the needle valve is opening, the actuator may jerk suddenly creating a dangerous situation.
   Moreover, the needle valve is closed by turning clockwise, and opened by turning counterclockwise. Therefore, the actuator speed is reduced by turning clockwise and increased by turning counterclockwise.
   When the product is used for an actuator operating vertically, the actuator may lurch depending on the load. For the adjustment method, please refer to “Selection and Adjustment” on page 15-16-6 to 15-16-7.
4. For installation and removal, tighten the body B by applying an appropriate wrench to the two opposite sides of the hexagon.
   Using other parts may destroy the valve. For alignment after installation, rotate body A manually.
5. Do not use universal type fittings at a position where they are constantly rotated.
The fittings may be damaged.
6. The valve cannot be used if there are fluctuations of the load.
The piston rod may jerk during operation.
7. In case a closed-center solenoid valve is used, switch to the center position only after pressure charge inside the cylinder at the stroke end is completed.
   If the pressure charge is insufficient, the piston rod may jerk after restart.

Selection

Caution
1. The proper tightening torque for pipe fittings is as shown in the table. As a rule, they should be tightened 2 to 3 turns with a tool after first tightening by hand.
   Be careful not to cause damage by over-tightening.

Handling of One-Touch Fittings

Caution
1. Installation and Removal of Tubing for One-Touch Fittings
   1) Installation of tubing
      (1) Using tube cutters TK-1, 2 or 3, take a tube having no flaws on its periphery and cut it off at a right angle. Do not use pinchers, nippers or scissors, etc. The tubing might be cut diagonally or flattened, making installation impossible or causing problems such as disconnection and leakage. Allow extra length for the tubing.
      (2) Hold the tubing and push it in slowly, inserting it securely all the way into the fitting.
      (3) After inserting the tubing, pull on it lightly to confirm that it will not come out. If it is not installed securely all the way into the fitting, problems such as leakage or disconnection of the tubing can occur.

   2) Removal of tubing
      (1) Push in the release button sufficiently, pressing the collar evenly around its circumference.
      (2) Pull out the tubing while holding down the release button so that it does not pop out. If the release button is not pressed down sufficiently, there will be increased bite on the tubing and it will become more difficult to pull it out.
      (3) When the removed tubing is to be used again, first cut off the section of the tubing which has been chewed. Using the chewed portion of the tube as it is can cause problems such as leakage or difficulty in removing the tubing.

Operating

Caution
1. The valve cannot be used if the same pressure is required for both the working and return strokes.
The pressure valve and flow valve are designed to save air by the difference in the operating pressure.
2. Install a flow valve on the working side which requires the cylinder output and a pressure valve on the return side. The cylinder may not operate if the valves are installed on the wrong sides.

3. If a closed-center, exhaust-center, pressure-center or perfect solenoid valve is used and the solenoid valve is set at the center position, the cylinder may move to the position where the pressure balance and load balance are achieved.
Safety Instructions

These safety instructions are intended to prevent a hazardous situation and/or equipment damage. These instructions indicate the level of potential hazard by labels of "Caution", "Warning" or "Danger". To ensure safety, be sure to observe ISO 4414 Note 1), JIS B 8370 Note 2) and other safety practices.

⚠️ Caution : Operator error could result in injury or equipment damage.

⚠️ Warning : Operator error could result in serious injury or loss of life.

⚠️ Danger : In extreme conditions, there is a possible result of serious injury or loss of life.

Note 1) ISO 4414: Pneumatic fluid power--General rules relating to systems.
Note 2) JIS B 8370: General Rules for Pneumatic Equipment

⚠️ Warning

1. The compatibility of pneumatic equipment is the responsibility of the person who designs the pneumatic system or decides its specifications.
Since the products specified here are used in various operating conditions, their compatibility for the specific pneumatic system must be based on specifications or after analysis and/or tests to meet your specific requirements. The expected performance and safety assurance will be the responsibility of the person who has determined the compatibility of the system. This person should continuously review the suitability of all items specified, referring to the latest catalog information with a view to giving due consideration to any possibility of equipment failure when configuring a system.

2. Only trained personnel should operate pneumatically operated machinery and equipment.
Compressed air can be dangerous if an operator is unfamiliar with it. Assembly, handling or repair of pneumatic systems should be performed by trained and experienced operators.

3. Do not service machinery/equipment or attempt to remove components until safety is confirmed.
   1. Inspection and maintenance of machinery/equipment should only be performed once measures to prevent falling or runaway of the driver objects have been confirmed.
   2. When equipment is to be removed, confirm the safety process as mentioned above. Cut the supply pressure for this equipment and exhaust all residual compressed air in the system.
   3. Before machinery/equipment is restarted, take measures to prevent shooting-out of cylinder piston rod, etc.

4. Contact SMC if the product is to be used in any of the following conditions:
   1. Conditions and environments beyond the given specifications, or if product is used outdoors.
   2. Installation on equipment in conjunction with atomic energy, railway, air navigation, vehicles, medical equipment, food and beverages, recreation equipment, emergency stop circuits, clutch and brake circuits in press applications, or safety equipment.
   3. An application which has the possibility of having negative effects on people, property, or animals, requiring special safety analysis.
Common Precautions
Be sure to read before handling.
For detailed precautions on every series, refer to main text.

### Selection

⚠️ **Warning**
1. Confirm the specifications.
   Products represented in this catalog are designed for use in compressed air applications only (including vacuum), unless otherwise indicated. Do not use the product outside their design parameters. Please contact SMC when using the products in applications other than compressed air (including vacuum).

### Operating Environment

⚠️ **Warning**
1. Do not use in environments where the product is directly exposed to corrosive gases, chemicals, salt water, water or steam.
2. Do not expose the product to direct sunlight for an extended period of time.
3. Do not use in a place subject to heavy vibrations and/or shocks.
4. Do not mount the product in locations where it is exposed to radiant heat.

### Mounting

⚠️ **Warning**
1. Instruction manual
   Install the products and operate them only after reading the instruction manual carefully and understanding its contents. Also keep the manual where it can be referred to as necessary.
2. Securing the space for maintenance
   When installing the products, please allow access for maintenance.
3. Tightening torque
   When installing the products, please follow the listed torque specifications.

### Piping

⚠️ **Caution**
1. Before piping
   Make sure that all debris, cutting oil, dust, etc, are removed from the piping.
2. Wrapping of pipe tape
   When screwing piping or fittings into ports, ensure that chips from the pipe threads or sealing material do not get inside the piping. Also, when the pipe tape is used, leave 1.5 to 2 thread ridges exposed at the end of the threads.

### Air Supply

⚠️ **Warning**
1. Operating fluid
   Please consult with SMC when using the product in applications other than compressed air (including vacuum). Regarding products for general fluid, please ask SMC about applicable fluids.
2. Install an air dryer, aftercooler, etc.
   Excessive condensate in a compressed air system may cause valves and other pneumatic equipment to malfunction. Installation of an air dryer, after cooler etc. is recommended.
3. Drain flushing
   If condensate in the drain bowl is not emptied on a regular basis, the bowl will over flow and allow the condensate to enter the compressed air lines. If the drain bowl is difficult to check and remove, it is recommended that a drain bowl with the auto-drain option be installed. For compressed air quality, refer to “Air Preparation Equipment” catalog.
4. Use clean air
   If the compressed air supply is contaminated with chemicals, synthetic materials, corrosive gas, etc., it may lead to break down or malfunction.

### Maintenance

⚠️ **Warning**
1. Maintenance procedures are outlined in the operation manual. Not following proper procedures could cause the product to malfunction and could lead to damage to the equipment or machine.
2. Maintenance work
   If handled improperly, compressed air can be dangerous. Assembly, handling and repair of pneumatic systems should be performed by qualified personnel only.
3. Drain flushing
   Remove drainage from air filters regularly. (Refer to the specifications.)
4. Shut-down before maintenance
   Before attempting any kind of maintenance make sure the supply pressure is shut of and all residual air pressure is released from the system to be worked on.
5. Start-up after maintenance and inspection
   Apply operating pressure and power to the equipment and check for proper operation and possible air leaks. If operation is abnormal, please verify product set-up parameters.
6. Do not make any modifications to be product. Do not take the product apart.
Quality Assurance Information (ISO 9001, ISO 14001)

Reliable quality of products in the global market

To enable our customers throughout the world to use our products with even greater confidence, SMC has obtained certification for international standards “ISO 9001” and “ISO 14001”, and created a complete structure for quality assurance and environmental controls. SMC products pursue to meet its customers’ expectations while also considering company’s contribution in society.

Quality management system
ISO 9001

This is an international standard for quality control and quality assurance. SMC has obtained a large number of certifications in Japan and overseas, providing assurance to our customers throughout the world.

Environmental management system
ISO 14001

This is an international standard related to environmental management systems and environmental inspections. While promoting environmentally friendly automation technology, SMC is also making diligent efforts to preserve the environment.
SMC products complying with EN/ISO, CSA/UL standards are supporting

The CE mark indicates that machines and components meet essential requirements of all the EC Directives applied. It has been obligatory to apply CE marks indicating conformity with EC Directives when machines and components are exported to the member Nations of the EU. Once “A manufacturer himself” declares a product to be safe by means of CE marking (declaration of conformity by manufacturer), free distribution inside the member Nations of the EU is permissible.

- **CE Mark**
  SMC provides CE marking to products to which EMC and Low Voltage Directives have been applied, in accordance with CETOP (European hydraulics and pneumatics committee) guidelines.

- **As of February 1998, the following 18 countries will be obliged to conform to CE mark legislation**
  Iceland, Ireland, United Kingdom, Italy, Austria, Netherlands, Greece, Liechtenstein, Sweden, Spain, Denmark, Germany, Norway, Finland, France, Belgium, Portugal, Luxembourg

- **EC Directives and Pneumatic Components**
  - **Machinery Directive**
    The Machinery Directive contains essential health and safety requirements for machinery, as applied to industrial machines e.g. machine tools, injection molding machines and automatic machines. Pneumatic equipment is not specified in Machinery Directive. However, the use of SMC products that are certified as conforming to EN Standards, allows customers to simplify preparation work of the Technical Construction File required for a Declaration of Conformity.
  
  - **Electromagnetic Compatibility (EMC) Directive**
    The EMC Directive specifies electromagnetic compatibility. Equipment which may generate electromagnetic interference or whose function may be compromised by electromagnetic interference is required to be immune to electromagnetic affects (EMS/immunity) without emitting excessive electromagnetic affects (EMI/emission).

  - **Low Voltage Directive**
    This directive is applied to products, which operate above 50 VAC to 1000 VAC and 75 VDC to 1500 VDC operating voltage, and require electrical safety measures to be introduced.

  - **Simple Pressure Vessels Directive**
    This directive is applied to welded vessels whose maximum operating pressure (PS) and volume of vessel (V) exceed 50 bar/L. Such vessels require EC type examination and then CE marking.
you to comply with EC directives and CSA/UL standards.

UL and CSA standards have been applied in North America (U.S.A. and Canada) symbolizing safety of electric products, and are defined to mainly prevent danger from electric shock or fire, resulting from trouble with electric products. Both UL and CSA standards are acknowledged in North America as the first class certifying body. They have a long experience and ability for issuing product safety certificate. Products approved by CSA or UL standards are accepted in most states and governments beyond question.

Since CSA is a test certifying body as the National Recognized Testing Laboratory (NRTL) within the jurisdiction of Occupational Safety and Health Administration (OSHA), SMC was tested for compliance with CSA Standards and UL Standards at the same time and was approved for compliance with the two Standards. The above CSA NRTL/C logo is described on a product label in order to indicate that the product is approved by CSA and UL Standards.

TSSA (MCCR) Registration Products
TSSA is the regulation in Ontario State, Canada. The products that the operating pressure is more than 5 psi (0.03 MPa) and the piping size is bigger than 1 inch. fall into the scope of TSSA regulation.

Products conforming to CE Standard

With CE symbol for simple visual recognition

In this catalog each accredited product series is indicated with a CE mark symbol. However, in some cases, every available models may not meet CE compliance. Please visit our web site for the latest selection of available models with CE mark.

http://www.smcworld.com
