Circulating Fluid Temperature Controller

Water-cooled Thermo-chiller Series HRW

Refrigerant-free and energy saving type using no compressor. Ideal for ordinary temperature and high temperature processes.

• Type of circulating fluid: Fluorinated fluids/Ethylene glycol aqueous solution/Clear water, Deionized water
• Temperature range setting: 68 to 194°F (20 to 90°C)
• Cooling capacity: 2 kW/8 kW/15 kW/30 kW
• Temperature stability: ±0.54°F (±0.3°C)

More effective energy-saving through use of an inverter pump

International standards: SEMATECH S2-93, S8-95 SEMI Standard S2-0703, S8-1103, F47-0200

Inverter type
Power consumption 0.5 kWh/h
Facility water 0.32 gpm (1.2 L/min)
Energy-Saving and Refrigerant-free

Energy-saving and refrigerant-free (Ordinary temperature up to 194°F (90°C))
The water-cooled Thermo-chiller which does not use a compressor (refrigerant-free) is suitable for processes operating from ordinary temperature to 194°F (90°C). The energy-savings shown below can be achieved in comparison with existing models (depending on the conditions).

- **Power consumption: Max. 59% reduction** *(SMC comparison)*
The power consumption can be reduced by direct heat exchange between the circulating fluid and facility water with no refrigerating circuit.

<table>
<thead>
<tr>
<th>Model</th>
<th>Power Consumption (kWh/h)</th>
<th>Operating Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Existing</td>
<td>4.6</td>
<td>140°F (60°C), 0 kW with 50% load, 8 kW with 50% load</td>
</tr>
<tr>
<td>HRW008-H</td>
<td>1.9</td>
<td></td>
</tr>
</tbody>
</table>

- **Facility water: Max. 89% reduction** *(SMC comparison)*
The HRW series can achieve reduction in power consumption as it does not have a compressor, and reduction in the amount of facility water used because heat is exchanged directly with the circulating fluid.

<table>
<thead>
<tr>
<th>Model</th>

**High Performance**

- **Temperature stability:** $\pm 0.54^\circ\text{F}$
  (when a load is stable)
  Enhanced temperature control technology achieved $\pm 0.54^\circ\text{F}$
  ($\pm 0.3^\circ\text{C}$) temperature stabilities when a load is stable.

- **Circulating fluid automatic recovery function**
  (Refer to “Options” on page 119.)
  Circulating fluid inside a Thermo-chiller tank can be recovered automatically. (Recovery volume: 3.2 gal (12 L))
  - Reduced maintenance time
  - Faster operation
  - Reduced circulating liquid loss by evaporation or spill

- **Cooling capacity:** Max. 30 kW
  Up to 30 kW cooling capacity achieved.

**Easy Maintenance**

- **Circulating fluid electrical resistivity control function**
  (Refer to “Options” on page 118.)
  (DI control kit)

**Easy maintenance**

- Checking the electrical component parts accessible from the front side only
- Possible to replace the maintenance parts (such as a pump) without removing the pipings and discharging the circulating fluid.
- Various alarm displays
  (Refer to page 117.)

---

### Graphs and Tables

- **Cooling capacity chart**
- **Temperature stability graph**
- **Flow diagram**
Electrical Resistivity Control

DI control kit
(Refer to “Options” on page 118.)
Electrical resistivity of circulating fluid (ethylene glycol aqueous solution and deionized water) can be controlled.

Communications

- Contact input/output signal
- Serial RS-485 communication
- Analog communication (Refer to “Options” on page 118.)
- DeviceNet communication (Refer to “Options” on page 118.)

Wetted parts adopt the materials compatible for various circulating fluids.
(Stainless steel, EPDM, etc.)
- Fluorinated fluids: Flourinert™ FC-40
  GALDEN® HT200
- 60% ethylene glycol aqueous solution
- Deionized water/Clear water

Regarding the fluid other than the above, please contact SMC.
Flourinert™ is a trademark of 3M. GALDEN® is a registered trademark of Solvay Solexis, Inc.

Construction and Principles

Circulating fluid circuit
With the circulating pump, circulating fluid will be discharged to the customer's machine side. After the circulating fluid will heat or cool the customer's machine side, it will be returned to the main tank via the heat exchanger.
When the automatic circulating fluid recovery function, which recovers the circulating fluid from the customer's machine, is selected (refer to page 99), a sub-tank for recovery is installed. The internal pump is used to transfer a circulating fluid from the sub-tank to the main tank.

Facility water circuit
When the circulating fluid temperature rises higher than the set temperature, open the solenoid valve to introduce facility water to the heat exchanger.
When the circulating fluid temperature falls back below the set temperature, close the solenoid valve to shut off facility water to the heat exchanger.
**Application Examples**

**Semiconductor**
- Example: Temperature control of chamber electrode
  - Upper electrode
  - Wafer
  - Lower electrode
- Etching equipment
- Spatter equipment
- Cleaning equipment
- Coating equipment
- Dicing equipment
- Tester, etc.

**Medical**
- Example: Blood preservation
- X-ray instrument
- MRI
- Blood preservation equipment

**Food**
- Example: Tofu (Bean curd) production
  - Bottle-cleaning machine
  - Tofu (Bean curd) production equipment
  - Noodle-making machine, etc.
  - Water temperature control for forming tofu by mixing the boiled soybean milk and bitter

**Analysis**
- Example: Electronic microscope
  - Electron microscope
  - X-ray analytical instrument
  - Gas chromatography
  - Sugar level analytical instrument, etc.
  - Prevents the distortion caused by the heat generated by the electron gun in an electronic microscope.

**Machine tool**
- Example: Laser machining
  - Wire cutting
  - Grinder
  - Spot welding
  - Plasma welding
  - Laser machining, etc.
  - Temperature-controlling the laser generating tube enables the laser wavelength to be optimised, improving the accuracy of the machined cross sectional area.

**Printing**
- Example: Printing temperature control
  - Offset printing machine
  - Automatic developing machine
  - UV equipment, etc.
  - Temperature-controlling the ink roller enables to control the evaporation amount and viscosity of an ink and optimise the tint of colors.

**Molding**
- Example: Injection molding
  - Plastic molding
  - Rubber molding
  - Wire cable coating machine
  - Injection molding, etc.
  - Temperature-controlling the mold results in improved product quality.

Guide to Model Selection

1. How much is the temperature in degrees centigrade for the circulating fluid?

Temperature range which can be set with the Thermo-chiller
H: 68 to 195°F (20°C to 90°C)

Example) Customer requirement: 122°F (50°C)

2. What kind of the circulating fluids will be used?

Relationship between circulating fluid (which can be used with the Thermo-chiller) and temperature

- Fluorinated fluids: Fluorinert™ FC-40/GALDEN® HT200
- 60% ethylene glycol aqueous solution
- Clear water/Deionized water

Example) Customer requirement: Clear water

3. How much is the temperature in degrees centigrade for the facility water?

Temperature range which can be set with the Thermo-chiller
10°C to 35°C

Example) Facility water temperature of customer’s machine: 15°C
Temperature difference between the circulating fluid and facility water is: 50 – 15 = 95°F (35°C).

4. What is the kW for the required cooling capacity?

Example) Customer requirement: 20 kW
Plot the point where the temperature difference between the circulating fluid and facility water (95°F (35°C)) intersects the cooling capacity (20 kW) in the cooling capacity graph.

[Cooling Capacity Graph] Circulating Fluid: Clear Water/Deionized Water

The point plotted in the graph is the requirement from your customer. Select the Thermo-chiller models exceeding this point. In this case, select the HRW030-H2.
Required Cooling Capacity Calculation

**Example 1:** When the heat generation amount in the customer’s machine is known.

Heat generation amount $Q$: 3.5 kW

Cooling capacity = Considering a safety factor of 20%, $3.5 \times 1.2 = \boxed{4.2 \text{ kW}}$

**Example 2:** When the heat generation amount in the customer’s machine is not known.

Obtain the temperature difference between inlet and outlet by circulating the circulating fluid inside the customer’s machine.

- Heat generation amount $Q$: Unknown
- Circulating fluid temperature difference $\Delta T = T_2 - T_1$: 6.0°C (6.0 K)
- Circulating fluid outlet temperature $T_1$: 20°C (293.15 K)
- Circulating fluid return temperature $T_2$: 26°C (299.15 K)
- Circulating fluid flow rate $L$: 20 L/min
- Circulating fluid
  - Density $\gamma$: 1.80 x 10³ kg/m³
  - Specific heat $C$: 0.96 x 10³ J/(kg·K)

$\Delta T = 26°C - 20°C = 6°C$

$Q = \frac{\Delta T \times L \times \gamma \times C}{860}$

$= \frac{6.0 \times 20 \times 1.80 \times 10^3 \times 0.96 \times 10^3}{60 \times 1000}$

$= \frac{3456 \text{ W}}{3.5 \text{ kW}}$

Cooling capacity = Considering a safety factor of 20%, $3.5 \times 1.2 = \boxed{4.2 \text{ kW}}$

---

* Refer to page 107 for the typical physical property values by circulating fluid.

**Example of conventional measurement units (Reference)**

- Unknown
- 6.0°C
- 20°C
- 26°C
- 1.2 m³/h
- Fluorinated fluid
- Density $\gamma$: 1.80 x 10³ kg/m³
- Specific heat $C$: 0.23 kcal/kg·°C (at 20°C)

* Refer to page 107 for the typical physical property values by circulating fluid.

$Q = \frac{\Delta T \times L \times \gamma \times C}{860}$

$= \frac{6.0 \times 1.2 \times 1.80 \times 10^3 \times 0.23}{860}$

$= 3.5 \text{ kW}$

Cooling capacity = Considering a safety factor of 20%, $3.5 \times 1.2 = \boxed{4.2 \text{ kW}}$

---

Thermo-chiller

**T2: Return temperature**

**$\Delta T = T_2 - T_1$**

**L**

**Customer’s machine**

**T1: Outlet temperature**
Example 3. When there is no heat generation, and when cooling the object below a certain temperature and period of time.

Cooled substance total volume \( V \) : 60 L
Cooling time \( h \) : 15 min
Cooling temperature difference \( \Delta T \) : 20°C (20 K) (70°C – 50°C → 20°C)
Facility water temperature : 20°C (293.15 K)
Circulating fluid : Fluorinated fluid
Density \( \gamma \) : 1.74 x 10³ kg/m³
Specific heat \( C \) : 1.05 x 10³ J/(kg·K)  
(at 50°C)

\[ Q = \frac{\Delta T \times V \times \gamma \times C}{h \times 60 \times 1000} \]
\[ = \frac{20 \times 60 \times 1.74 \times 10^3 \times 1.05 \times 10^3}{15 \times 60 \times 1000} \]
\[ = 2436 \text{ W} = 2.4 \text{ kW} \]

Cooling capacity = Considering a safety factor of 20%,
\[ 2.4 \times 1.2 = 2.9 \text{ kW} \text{ (When the circulating fluid temperature is 50°C.)} \]

(In this case, selected Thermo-chiller model will be the HRW008-H.)

```
Thermo-chiller
```

```
Water bath
```

```
50°C
```

```
V
```

After 15 min, cool 70°C down to 50°C.

Example of conventional measurement units (Reference)
0.06 m³
0.25 h
20°C
20°C
Fluorinated fluid
Density \( \gamma \) : 1.74 x 10³ kg/m³
Specific heat \( C \) : 0.25 kcal/kg·°C  
(at 50°C)

\[ Q = \frac{\Delta T \times V \times \gamma \times C}{h \times 860} \]
\[ = \frac{20 \times 0.06 \times 1.74 \times 10^3 \times 0.25}{0.25 \times 860} \]
\[ = 2.4 \text{ kW} \]

Cooling capacity = Considering a safety factor of 20%,
\[ 2.4 \times 1.2 = 2.9 \text{ kW} \text{ (When the circulating fluid temperature is 50°C.)} \]

(In this case, selected Thermo-chiller model will be the HRW008-H.)

```
Note) This is the calculated value by changing the fluid temperature only. 
Thus, it varies substantially depending on the water bath or piping material or shape.
```

### Precautions on Model Selection

1. **Temperature difference between the circulating fluid and facility water**
   
   The HRW series exchanges heat between the circulating fluid and facility water directly, so it may not be possible to lower the circulating fluid temperature to the set temperature if the facility water temperature is too high. Check that the facility water temperature can be maintained for the circulating fluid temperature referring to the cooling capacity graph of each model before using.

2. **Heating capacity**
   
   When setting the circulating fluid temperature at a higher temperature than the room temperature, the circulating fluid temperature will be heated with the Thermo-chiller. Heating capacity varies depending on the circulating fluid temperature. Also, the heating capacity varies depending on the circulating fluid temperature. Consider the heat radiation amount or thermal capacity of the customer's equipment. Check beforehand if the required heating capacity is provided, based on the heating capacity graph for the respective model.

3. **Pump capacity**
   
   **<Circulating fluid flow rate>**
   
   Pump capacity varies depending on the model selected from the HRW series. Also, circulating fluid flow varies depending on the circulating fluid discharge pressure. Consider the installation height difference between our Thermo-chiller and a customer's machine, and the piping resistance such as circulating fluid pipings, or piping size, or piping curves in the machine. Check beforehand if the required flow rate is achieved, using the pump capacity curves for each respective model.

   **<Circulating fluid discharge pressure>**
   
   Circulating fluid discharge pressure has the possibility to increase up to the maximum pressure in the pump capacity curves for the respective model. Check beforehand if the circulating fluid pipings or circulating fluid circuit of the customer's machine are fully durable against this pressure.

**Notes**

1. It should have no condensation.
2. Fluoorinet™ is a trademark of 3M and GALDEN® is a registered trademark of Solvay Solexis, Inc. Regarding the fluid other than the above, please contact SMC.
3. Outlet temperature when the circulating fluid and facility water are rated flow, and the circulating fluid outlet and return port are directly connected. Installation environment, power supply, and facility water are within specification range and stable. Value obtained 10 minutes after the external load is stabilized. It may be out of ±0.54°F (±0.3°C) in some other operating conditions.
4. The capacity at the circulating fluid outlet when the circulating fluid temperature is 68°F (20°C). Pump capacity at 60 Hz indicates the maximum capacity of the HRW/HRW-HS (pump inverter type).
5. Applicable to the HRW/HRW-HS (pump inverter type) only.
6. Minimum volume required for operating only the Thermo-chiller. (Circulating fluid temperature: 68°F (20°C), including the Thermo-chiller's internal piping or heat exchanger)
7. The automatic circulating fluid recovering function will be provided by selecting option Z for collecting the circulating fluid inside an external piping.
8. Required flow rate for cooling capacity or maintaining the temperature stability.
9. Panel dimensions. These dimensions do not include possible protrusions such as a breaker handle.
10. Weight in the dry state without circulating fluids.

### Notes

1. It should have no condensation.
2. Dilute pure ethylene glycol with clear water. Additives invading wetting parts material such as preservatives cannot be used.
3. Outlet temperature when the circulating fluid and facility water are rated flow, and the circulating fluid outlet and return port are directly connected. Installation environment, power supply, and facility water are within specification range and stable. Value obtained 10 minutes after the external load is stabilized (after stabilization with no load for HRW030-H1). It may be out of this range when a DI control kit (option Y) is used or in some other operating conditions.

## Specifications

- **Cooling method**: Water-cooled
- **Ambient temperature/humidity**: Temperature: 50 to 95°F (10 to 35°C), Humidity: 30 to 70%RH
- **Circulating fluid**: 60% ethylene glycol aqueous solution
- **Temperature range setting**: 68 to 194°F (20 to 90°C)
- **Cooling capacity (50/60 Hz common) (kW)**: 2 kW, 8 kW, 15 kW, 30 kW
- **Temperature stability**: ±0.5°F (±0.3°C)
- **Circulating fluid flow**: 0.8 to 4.2 gpm (3 to 16 L/min)
- **Tank capacity**: Approx. 3.4 gal (13 L)
- **Port size**: Rc3/4
- **Wetted parts material**: Nickel brazing (Heat exchanger), Stainless steel, EPDM, Silicone, PPS, Fluororesin
- **Temperature range**: 50 to 95°F (10 to 35°C)
- **Required flow rate**: 2.6 gpm (10 L/min)
- **Power supply**: 3-phase 200/200 to 208 VAC ±10%
- **Max. operating current (A)**: 26
- **Breaker capacity (A)**: 30
- **Communications**: Serial RS-485 (D-sub 9 pin) and Contact input/output (D-sub 25 pin)
- **Dimensions**: W15 in (380mm) x D 26.2 in (665mm) x H33.9 in (860mm)
- **Weight (dry state)**: Approx. 198 lbs (90 kg)
- **Safety standards**: U.L., CE marking, SEMI (S2-0703, S8-1103, F47-0200), SEMATECH (S2-93, S8-95)

**Safety standards**
- UL, CE marking, SEMI (S2-0703, S8-1103, F47-0200), SEMATECH (S2-93, S8-95)

**Note 1)** It should have no condensation.

**Note 2)** If clear water or deionized water is used, please use water that conforms to Water Quality Standards of the Japan Refrigeration and Air Conditioning Industry Association (JRA GL-02-1994/cooling water system - circulation type - make-up water). The electrical conductivity of the deionized water used as the fluid varies depending on the operating conditions.

**Note 3)** Outlet temperature when the circulating fluid and facility water are rated flow, and the circulating fluid outlet and return port are directly connected. Installation environment, power supply, and facility water are within specification range and stable. Value obtained 10 minutes after the external load is stabilized (after stabilization with no load for HRW030-H2). It may be out of this range when a DI control kit (option Y) is used or in some other operating conditions.

**Note 4)** The capacity at the circulating fluid outlet when the circulating fluid temperature is 68°F (20°C). Pump capacity at 60 Hz indicates the maximum capacity of the HRW002-H2S (pump inverter type).

**Note 5)** Applicable to the HRW002-H2S (pump inverter type) only.

**Note 6)** Minimum volume required for operating only the Thermo-chiller. (Circulating fluid temperature: 68°F (20°C), including the Thermo-chiller’s internal piping or heat exchanger).

**Note 7)** The automatic circulating fluid recovering function will be provided by selecting option Z for collecting the circulating fluid inside an external piping.

**Note 8)** Required flow rate for cooling capacity or maintaining the temperature stability.

**Note 9)** Paneldimensions. These dimensions do not include possible protrusions such as a breaker handle.

**Note 10)** Weight in the dry state without circulating fluids.

### Input signal

- **Insulation method**: Photocoupler
- **Rated input voltage**: 24 VDC
- **Operating voltage range**: 21.6 to 26.4 VDC
- **Rated input current**: 5 mA TYP
- **Input impedance**: 4.7 kΩ

### Output signal

- **Rated load voltage**: 48 VAC or less/30 VDC or less
- **Maximum load current (total)**: When using the power supply of the Thermo-chiller: 200 mA DC (resistance load/inductive load)
  When using the power supply of the customer's machine: 800 mA AC/DC (resistance load/inductive load)

### Alarm signal

- **Rated load voltage**: 48 VAC or less/30 VDC or less
- **Maximum load current**: 800 mA AC/DC (resistance load/inductive load)

### EMO signal

- **Rated load voltage**: 48 VAC or less/30 VDC or less
- **Maximum load current**: 800 mA AC/DC (resistance load/inductive load)

---

**Note:** The custom function is equipped for contact input/output. Using the custom function enables the customer to set the signal type for contact input/output or pin assignment numbers. For details, please consult “Communication Specifications” information.

**Series HRW Options**

**C** Option symbol

**Analog Communication**

HRW [ ] – [ ] – C

Analog communication

In addition to the standard contact input/output signal communication and the serial RS-485 communication, analog communication function can be added. The analog communication function enables to write and read out the following items.

**<Writing>**
- Circulating fluid temperature
- Circulating fluid present temperature setting

**<Readout>**
- Circulating fluid present temperature
- Electrical resistivity

* Only when the DI control kit (option Y) is selected.

Scaling voltage - circulating fluid temperature can be set arbitrarily by the customer.

For details, please consult our "Communication Specifications" information.

**D** Option symbol

**DeviceNet Communication**

HRW [ ] – [ ] – D

DeviceNet communication

In addition to the standard contact input/output signal communication and the serial RS-485 communication, DeviceNet function can be added. DeviceNet function enables to write and read out the following items.

**<Writing>**
- Run/Stop
- Circulating fluid temperature setting
- Circulating fluid automatic recovery start/stop

**<Readout>**
- Circulating fluid present temperature
- Circulating fluid flow
- Circulating fluid discharge pressure
- Electrical resistivity
- Alarm occurrence information
- Status (operating condition) information

* Only when the circulating fluid automatic recovery function (option Z) is selected.

* Only when the DI control kit (option Y) is selected.

For details, please consult our "Communication Specifications" information.

**N** Option symbol

**NPT Fitting**

HRW [ ] – [ ] – N

NPT fitting

An adapter is included to change the connection parts of circulating fluid piping and facility water piping to NPT thread type. The adapter must be installed by the customer.

**Y** Option symbol

**DI Control Kit**

HRW [ ] – [ ] – Y

DI control kit

Select this option if you want to maintain the electrical resistivity (DI level) of the circulating fluid at a certain level. However, some components have to be fitted by customer. For details, refer to specification table for this option.

Please note that this is not applicable to the fluorinated liquid type.

---

**Note**

Options have to be selected when ordering the Thermo-chiller. It is not possible to add them after purchasing the unit.

---

(Note) The DI filter is needed to control the DI level. (SMC Part No.: HRZ-DF001)

Please purchase additionally because the DI filter is not included in this option. Also, if necessary, additionally purchase the insulating material for the DI filter. (SMC Part No.: HRZ-DF002)

---

* Install the DI filter outside the Thermo-chiller for piping. Secure the space for installing the DI filter in the rear side of the Thermo-chiller.
* May go outside of the temperature stability range of ±0.3°C when this option is used in some operating conditions.

---

DI tube
(1 piece each attached for IN/OUT)

DI filter
(Optional accessories)
(Refer to page 121.)

* Please order separately.
Circulating fluid Automatic Recovery

HRW □□□ - □□□ - Z

Select this option for customers who want to use the circulating fluid automatic recovery function. The automatic recovery function is a device which can recover the circulating fluid inside pipings into a sub-tank of the Thermo-chiller by the external communication or operation display panel.

Some components need to be fitted by the customer. For details, consult "Product Specifications" information for these options.

<td>Height difference with the customer system side</td>
<td>32.8 ft (10 m) or less</td>
</tr>
</tbody>
</table>

Note 1) This is the space volume of the sub-tank when the liquid level of the circulating fluid is within the specification. Guideline of the recovery volume is 80% of the circulating fluid recoverable volume.

Note 2) Before piping, clean inside the pipings with air blow, etc. Use the piping with no dust generation by purge gas. When using resin tube, where necessary, use insert fittings, etc. in order not to deform the tubings when connecting to self-align fittings.

Note 3) At the time of shipping from factory, it is set to 29 psi (0.2 MPa).

Note 4) For details, please consult our “Communication Specifications” information.
By-pass Piping Set

When the circulating fluid goes below the rated flow, cooling capacity will be reduced and the temperature stability will be badly affected. In such a case, use the by-pass piping set.

DI Filter

This is the ion replacement resin to maintain the electric resistivity of the circulating fluid. Customers who selected the DI control kit (option Y) need to purchase the DI filter separately.

Insulating Material for DI Filter

When the DI filter is used at a high temperature, we recommend that you use this insulating material to protect the radiated heat from the DI filter or possible burns. We also recommend that you use this to prevent heat absorption from the DI filter and to avoid forming condensation.

<table>
<thead>
<tr>
<th>Part no.</th>

**Specific Product Precautions 1**

**Design**

**Warning**

1. **This catalog shows the specifications of a single unit.**
   1. For details, please consult our “Product Specifications” and thoroughly consider the adaptability between the customer’s system and this unit.
   2. Although the protection circuit as a single unit is installed, the customer is requested to carry out the safety design for the whole system.

**Caution**

1. **Model selection**
   In order to select the correct Thermo-chiller model, the amount of thermal generation from the customer’s system, the operating circulating fluid, and its circulating flow are required. Select a model, by referring to the guideline to model selection on page 104.

2. **Option selection**
   Options have to be selected when ordering the Thermo-chiller. It is not possible to add them after purchasing the unit.

**Handling**

**Warning**

1. **Thoroughly read the Operation Manual.**
   Read the Operation Manual completely before operation, and keep this manual available whenever necessary.

**Operating Environment/Storage Environment**

**Caution**

1. **Do not use in the following environment because it will lead to a breakdown.**
   1. Environment like written in “Temperature Control Equipment Precautions.”
   2. Locations where spatter will adhere to when welding.
   3. Locations where it is likely that the leakage of flammable gas may occur.
   4. Locations where the ambient temperature exceeds the limits as mentioned below.
      - During operation 50 to 95°F (10 to 35°C)
      - During storage 32 to 122°F (0 to 50°C) (but as long as water or circulating fluid are not left inside the pipings)
   5. Locations where the ambient relative humidity exceeds the limit as mentioned below.
      - During operation 30% to 70%
      - During storage 15% to 85%
   6. (Inside the operation facilities) locations where there is not sufficient space for maintenance.
   7. In locations where the ambient pressure exceeds the atmospheric pressure.

2. **The Thermo-chiller does not have clean room specification.** It generates dust from the pump inside the unit and the cooling fan for the unit inside.

**Circulating Fluid**

**Caution**

1. **Avoid oil or other foreign objects entering the circulating fluid.**
2. **Use ethylene glycol that does not contain additives such as preservatives.**
3. **The condensation of ethylene glycol aqueous solution must be 60% or less.** If the condensation is too high, the pump will be overloaded, resulting in occurrence of “Pump Breaker Trip FLT”.
4. **Avoid water moisture entering the fluorinated fluid.**
5. **Use clear water (including for diluting ethylene glycol aqueous solution) which must meet the water quality standards as mentioned below.**

**Clear Water (as Circulating Fluid) Quality Standards**

* In the case of [µS/cm], it will be 0.003 to 0.01.
* ○: Factors that have an effect on corrosion or scale generation.
* Even if the water quality standards are met, complete prevention of corrosion is not guaranteed.

**Transportation/Transfer/Movement**

**Warning**

1. **Transportation by forklift**
   1. It is not possible to hang this product.
   2. The fork insertion position is either on the left side face or right side face of the unit. Be careful not to bump the fork against a caster or level foot and be sure to put through the fork to the opposite side.
   3. Be careful not to bump the fork to the cover panel or piping ports.

2. **Transportation by casters**
   1. This product is heavy and should be moved by at least two people.
   2. Do not grip the pipings on the rear side or the handles of the panel.

SMC

---

**Technical Data**

123

---
1. Regarding the circulating fluid pipings, consider carefully the suitability for shutoff pressure, temperature and circulating fluid. If the operating performance specifications are regularly exceeded, the pipings may burst during operation.

2. The surface of the circulating fluid pipings should be covered with the insulating materials which can effectively confine the heat. Absorbing the heat from the surface of pipings may reduce the cooling capacity performance and the heating capacity may be shortened due to heat radiation.

3. When using fluorinated liquid as the circulating fluid, do not use pipe tape. Liquid leakage may occur around the pipe tape. For sealant, we recommend that you use the following sealant: SMC Part No., HRZ-S0003 (Silicone sealant)

4. For the circulating fluid pipings, use clean pipings which have no dust, oil or water moisture inside the pipings, and blow with air prior to undertaking any piping works. If any dust, oil or water moisture enters the circulating fluid circuit, inferior cooling performance or equipment failure due to frozen water may occur, resulting in bubbles in the circulating fluid inside the tank.

5. Select the circulating fluid pipings which can exceed the required rated flow. For the rated flow, refer to the pump capacity table.

6. For the circulating fluid piping connection, install a drain pan just in case the circulating fluid may leak.

7. Do not return the circulating fluid to the unit by installing a pump in the customer system.

---

**Mounting/Installation**

**Caution**

1. Avoid using this product outdoors.
2. Install on a rigid floor which can withstand this product's weight.
3. Please install a suitable anchor bolt for the anti-seismic bracket taking into consideration the customers floor material.
4. Avoid placing heavy objects on this product.

---

**Electrical Wiring**

**Caution**

1. Power supply and signal cable should be prepared by the customer.
2. Provide a stable power supply which is not affected by surge or distortion. If the voltage increase ratio (dV/dt) at the zero cross should exceed 40 V/200 µsec., it may result in a malfunction.
3. This product is installed with a breaker with the following operating characteristics.
   For the customer's machine (inlet side), use a breaker whose operating time is equal to or longer than the breaker of this product. If a breaker with shorter operating time is connected, the customer's machine could be cut off due to the inrush current of the motor of this product.

---

**Piping**

**Caution**

1. Regarding the circulating fluid pipings, consider carefully the suitability for shutoff pressure, temperature and circulating fluid.
   If the operating performance specifications are regularly exceeded, the pipings may burst during operation.

2. The surface of the circulating fluid pipings should be covered with the insulating materials which can effectively confine the heat.

3. When using fluorinated liquid as the circulating fluid, do not use pipe tape. Liquid leakage may occur around the pipe tape. For sealant, we recommend that you use the following sealant: SMC Part No., HRZ-S0003 (Silicone sealant)

4. For the circulating fluid pipings, use clean pipings which have no dust, oil or water moisture inside the pipings, and blow with air prior to undertaking any piping works.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Maintenance</th>
</tr>
</thead>
</table>

⚠️ Caution

1. Confirmation before operation
   1. The circulating fluid should be within the specified range of “HIGH” and “LOW”.
   2. Be sure to tighten the cap for the circulating fluid port until the click sound is heard.

2. Emergency stop method
   In the case of an emergency, press down the EMO switch which is fitted on the front face of this product.

⚠️ Warning

1. Do not operate the switch with wet hands or touch electrical parts such as an electrical plug. This will lead to an electrical shock.

2. Do not splash water directly on this product for cleaning. This will lead to an electrical shock or a fire.

3. When the panel was removed for the purpose of inspection or cleaning, mount the panel after works were done.
   If the panel is still open, or running the equipment with the panel removed, it may cause an injury or electric shock.

⚠️ Caution

1. In order to prevent a sudden product failure of the unit, replace the replacement parts every 36 months.

2. Perform an inspection of the circulating fluid every 3 months.
   1. In the case of fluorinated fluids:
      Discharge the circulating liquid and avoid any dirty objects, or water moisture, or foreign objects entering the system.
   2. In the case of ethylene glycol aqueous solution:
      Maintain the condensation at 60%.
   3. In case of clear water, deionized water:
      Replacement is recommended.

3. Check the water quality of facility water every 3 months.
   Regarding the water quality standards for facility water, refer to “Temperature Control Equipment Precautions”.
