Note 1) Based on dynamic performance test JIS B8374-1981 (standard type: at coil temperature of 20°C, with rated voltage, without surge voltage suppressor)
Note 2) Impact resistance: No malfunction resulted in an impact test using a drop impact tester. The test was performed one time each in the axial and right angle directions of the main valve and armature, for both energized and de-energized states. (Value in the initial stage)
Vibration resistance: No malfunction resulted in 45 to 2000 Hz, a one-sweep test performed in the axial and right angle directions of the main valve and armature for both energized and de-energized states. (Value in the initial stage)

Type S41 Manifold: Side Ported/VV100-S41- [Stations] -M5

Grommet (G), (H)

- Other dimensions are same as the grommet type.

L plug connector (L)

- Other dimensions are same as the grommet type.

M plug connector (M)

Note) [ ]: AC
< >: values for the large flow type (A)
These safety instructions are intended to prevent a hazardous situation and/or equipment damage. These instructions indicate the level of potential hazard by a label of "Caution", "Warning" or "Danger". To ensure safety, be sure to observe ISO 4414 Note 1), JIS B 8370 Note 2) and other safety practices.

**Caution**: Operator error could result in injury or equipment damage.

**Warning**: Operator error could result in serious injury or loss of life.

**Danger**: In extreme conditions, there is a possible result of serious injury or loss of life.

---

**Warning**

1. **The compatibility of pneumatic equipment is the responsibility of the person who designs the pneumatic system or decides its specifications.**
   
   Since the products specified here are used in various operating conditions, their compatibility for the specific pneumatic system must be based on specifications or after analysis and/or tests to meet your specific requirements. The expected performance and safety assurance will be the responsibility of the person who has determined the compatibility of the system. This person should continuously review the suitability of all items specified, referring to the latest catalog information with a view to giving due consideration to any possibility of equipment failure when configuring a system.

2. **Only trained personnel should operate pneumatically operated machinery and equipment.**
   
   Compressed air can be dangerous if handled incorrectly. Assembly, handling or maintenance of pneumatic systems should be performed by trained and experienced operators.

3. **Do not service machinery/equipment or attempt to remove components until safety is confirmed.**
   
   1. Inspection and maintenance of machinery/equipment should only be performed once measures to prevent falling or runaway of the driven object have been confirmed.
   2. When equipment is to be removed, confirm the safety process as mentioned above. Cut the supply pressure for this equipment and exhaust all residual compressed air in the system.
   3. Before machinery/equipment is restarted, take measures to prevent shooting-out of cylinder piston rod, etc.

4. **Contact SMC if the product is to be used in any of the following conditions:**
   
   1. Conditions and environments beyond the given specifications, or if product is used outdoors.
   2. Installation on equipment in conjunction with atomic energy, railway, air navigation, vehicles, medical equipment, food and beverages, recreation equipment, emergency stop circuits, clutch and brake circuits in press applications, or safety equipment.
   3. An application which has the possibility of having negative effects on people, property, or animals, and therefore requires special safety analysis.
### Design

**Warning**

1. **Actuator drive**
   When an actuator, such as a cylinder, is to be driven using a valve, take appropriate measures to prevent potential danger caused by actuator operation.

2. **Effect of back pressure when using a manifold**
   Use caution when the valves are used on a manifold, as actuator malfunction due to back pressure may occur. Special caution is also necessary when driving a single acting cylinder. Take additional care in cases where there is a danger of malfunction due to this potential back-pressure.

3. **Holding pressure (including vacuum)**
   Since valves are subject to air leakage, they cannot be used for applications such as holding pressure (including vacuum) in a pressure vessel.

4. **The valve cannot be used as an emergency shutoff valve, etc.**
   The valves presented in this catalog are not designed for safety applications such as an emergency shutoff valve. If the valves are used in this type of system, other reliable safety assurance measures should also be adopted.

5. **Maintenance space**
   The installation should allow sufficient space for maintenance activities (removal of valve, etc.).

6. **Release of residual pressure**
   Provide a residual pressure release function for maintenance purposes.

7. **Vacuum applications**
   When a valve is used for vacuum switching, take appropriate measures against the suction of external dust or other contaminants through vacuum pads and exhaust ports.

8. **Ventilation**
   When a valve is used inside a sealed control panel, etc., provide ventilation to prevent a pressure increase caused by exhausted air inside the control panel or temperature rise caused by the heat generated by the valve.

### Selection

**Warning**

1. **Confirm the specification.**
   The products presented in this catalog are designed only for use in compressed air systems (including vacuum). Do not operate at pressures or temperatures, etc., beyond the range of specifications, as this can cause damage or malfunction. (Refer to specifications.)
   Contact SMC when using a fluid other than compressed air (including vacuum).

2. **Extended periods of continuous energization**
   - If a valve is continuously energized for long periods, heat generation of the coil may result in reduced performance and shorter service life. This may also have an adverse effect on the peripheral equipment in proximity. Should a valve be continuously energized for long periods, or its daily energized state exceeds its non energized state, please use an energy saving type valve with DC specifications. Under some operating conditions, alternative valves from those detailed above can be used (for example, valves with DC specifications). For more information, consult with SMC. It is also possible to avoid potential problems by shortening the energization time and using the valve as a N.O. (normally open) type.
   - When solenoid valves are mounted in a control panel, employ measures to radiate excess heat, so that temperatures remain within the valve specification range. Use special caution when three or more stations sequentially aligned on the manifold are continuously energized since this will cause a drastic temperature rise.

**Caution**

1. **Leakage voltage**
   When using a resistor in parallel with the switching element or using a C-R element (surge voltage suppressor) for protection of the switching element, note that leakage voltage will increase due to leakage current flowing through the resistor or C-R element. Limit the amount of residual leakage voltage to the following value:
   - DC coil: 3% or less of the rated voltage
   - AC coil: 8% or less of the rated voltage

2. **Solenoid valve drive for AC with solid state output (SSR, TRIAC output, etc.)**
   1) Voltage leakage
      When using a snubber circuit (C-R element) for surge protection of the output element, a very small electric current will still continue to flow in spite of the OFF state. This results in the valve not returning. In the cases when exceeding the tolerance as shown above, take measures to install a bleeder resistor.
   2) Minimum allowable load (Minimum load current)
      When the current consumption of the valve is less than, or close to, the minimum allowable load of the output element, this may cause the output element not to switch normally. Please consult SMC for details.

3. **Surge voltage suppressor**
   If a surge protection circuit contains non-ordinary diodes such as Zener diodes or ZNRs, a residual voltage that is in proportion to the protective elements and the rated voltage will remain. Therefore, give consideration to surge voltage protection of the controller. In the case of diodes, the residual voltage is approximately 1 V.

4. **Low temperature operation**
   Take appropriate measures to avoid freezing of drainage, moisture, etc. Valve use is still possible to temperature extremes of −10°C, unless there are specific instructions on the valve.

5. **Mounting orientation**
   The mounting orientation is unrestricted.
3 Port Solenoid Valves/Common Precautions 2
Be sure to read before handling.

**Warning**
1. If air leakage increases or equipment does not operate properly, stop operation.
   Check mounting conditions when air and power supplies are connected. Initial function and leakage tests should be performed after installation.

2. Instruction manual
   Mount and operate the product after reading the manual carefully and understanding its contents. Also keep the manual where it can be referred to as necessary.

3. Painting and coating cases
   Warnings or specifications printed or pasted on the product should not be erased, removed or covered up. Consult with SMC if paint is to be applied to resinous parts, as this may have an adverse effect due to the paint solvent.

**Piping**

**Caution**
1. Preparation before piping
   Before piping is connected, it should be thoroughly blown out with air (flushing) or washed to remove chips, cutting oil and other debris from inside the pipe.

2. Wrapping of sealant tape
   When connecting pipes and fittings, etc., be sure chips from the pipe threads and sealing material do not get inside the valve. Furthermore, when sealant tape is used, leave 1.5 to 2 thread ridges exposed at the end of the threads.

3. Screwing in fitting
   When screwing fittings into valves, tighten as follows.
   1) For M5
      (1) When installing SMC fittings, etc., follow the procedures below.
      After tightening by hand, tighten an additional 1/6 rotation for M5 with a tool. However, when using a miniature fitting, tighten an additional 1/4 rotation with a tool after tightening by hand. Also, when there are 2 gaskets such as in case of a universal elbow or universal tee, tighten an additional 1/2 rotation.
      Note: If overtightened, threaded part may be broken or gasket deformed. If tightened insufficiently, thread part may be loosened. In either case, air leakage could occur.
      (2) When using a fitting brand other than SMC, follow the instruction by the manufacturer of the fittings.

4. Connection of piping to products
   When connecting piping to a product, refer to its instruction manual to avoid mistakes regarding the supply port, etc.

**Wiring**

**Caution**
1. 1. Polarity
   When connecting power to a DC specification solenoid valve with (light/) surge voltage suppressor, confirm whether or not there is polarity.
   Please use caution for the following cases involving polarity.
   In the case where a diode is not provided to protect the valve’s polarity (including any power saving circuit):
   - If the polarity reversed, the diode inside the valve or the switching element in the controlling equipment side and or the power supply equipment will likely burn.
   In the case where a diode is provided to protect the valve’s polarity:
   - If the polarity is reversed, it will not be possible to switch the valve.

2. Applied voltage
   When electric power is connected to a solenoid valve, be careful to apply the proper voltage. Improper voltage may cause malfunction or coil damage.

3. Confirm the connections.
   After completing the wiring, confirm that the connections are correct.

4. External stress to the lead wire
   Excessive stress to the lead wire will likely cause the wire to break. Take measures to prevent a force of 30 N or greater from being applied to the lead wire.

**Lubrication**

**Caution**
1. Lubrication
   1) The valve has been lubricated for life at the manufacturer, and does not require any further lubrication.
   2) If a lubrication is applied in the system, use turbine oil Class 1 (no additive), ISO VG32.
   However, once lubrication is applied it must be continued, as loss of the original lubricant may lead to malfunction.

   Class 1 Turbine Oil (with no additive), ISO VG32

Contact SMC regarding Class 2 turbine oil (with additives), ISO VG32.
## Air Supply

### Warning
1. **Use clean air.**
   Do not use compressed air which contains chemicals, synthetic oils containing organic solvents, salts or corrosive gases, etc., as this can cause damage or malfunction.

### Caution
1. **Install air filters.**
   Install filters close to valves at their upstream side. A filtration degree of 5 µm or less should be selected.
2. **Install an air dryer, after cooler or Drain Catch, etc.**
   Air that includes excessive drainage may cause malfunction of valves and other pneumatic equipment. To prevent this, install an air dryer, after-cooler or water separator, etc.
3. **If excessive carbon powder is seen, install a mist separator on the upstream side of the valve.**
   If excessive carbon dust is generated by the compressor, it may adhere to the inside of valves and cause malfunction. Refer to “SMC Best Pneumatic” catalog Vol. 14 for compressed air quality.

## Operating Environment

### Warning
1. **Do not use in atmospheres where the valve is in direct contact with corrosive gases, chemicals, salt water, water or steam.**
2. **Do not use in an explosive atmosphere.**
3. **Do not use in locations subject to vibration or impact. Confirm the specifications in the main section of the catalog.**
4. **Use a protective cover, etc., to shield valves from direct sunlight.**
5. **Shield valves from radiated heat generated by nearby heat sources.**
6. **Employ suitable protective measures in locations where there is contact with oil or welding spatter, etc.**
7. **When solenoid valves are mounted in a control panel or are energized for extended periods of time, employ measures to radiate excess heat, so that temperatures remain within the valve specification range.**

## Maintenance

### Warning
1. **Perform maintenance procedures as shown in the instruction manual.**
   If handled improperly, malfunction or damage of machinery or equipment may occur.
2. **Removal of equipment and supply/exhaust of compressed air**
   When equipment is serviced, first confirm that measures are in place to prevent dropping of work pieces and run-away of equipment, etc. Then cut the supply pressure and power, and exhaust all compressed air from the system using its residual pressure release function. When the equipment is to be started again after remounting or replacement, first confirm that measures are in place to prevent lurching of actuators, etc., and then confirm that the equipment is operating normally.
3. **Low frequency operation**
   Valves should be switched at least once every 30 days to prevent malfunction. (Use caution regarding the air supply.)
4. **Manual override operation**
   When the manual override is operated, connection equipment will be actuated. Start the operation after confirming its safety.

### Caution
1. **Drain flushing**
   Remove drainage from air filters regularly.
**Warning**

Manual Override Operation

Since connected equipment will be actuated when the manual override is operated, first confirm that conditions are safe.

- **Non-locking push type**
  - [Standard type]
  - Press in the direction of the arrow

- **Locking slotted type**
  - [B type]
  - Turn in the direction of arrow.

**Caution**

When operating with a screw driver, turn it gently using a watchmakers’ screw driver. [Torque: less than 0.1Nm]

---

**Caution**

How to Use a Plug Connector

3. Attaching and detaching lead wires with sockets

- **Attaching**
  - Insert the sockets into the square holes of the connector (+, – indication), and continue to push the sockets all the way in until they lock byhooking into the seats in the connector. (When they are pushed in, their hooks open and they are locked automatically.) Then confirm that they are locked by pulling lightly on the lead wires.

- **Detaching**
  - To detach a socket from a connector, pull out the lead wire while pressing the socket's hook with a stick having a thin tip (about 1 mm). If the socket will be used again, first spread the hook outward.

---

**How to Order Connector Assembly**

For DC: **SY100 – 30 – 4A**

For 100 VAC: **SY100 – 30 – 1A**

For 200 VAC: **SY100 – 30 – 2A**

For other voltages of AC: **SY100 – 30 – 3A**

Without lead wire: **SY100 – 30 – A**

(with connector and 2 sockets)

**Plug Connector Lead Wire Length**

Standard length is 300 mm, but the following length is also available.

<table>
<thead>
<tr>
<th>Lead wire length</th>

**How to Order**

To order a valve with lead wire length of other than 300 mm, indicate part numbers of the valve without connector and the required connector assembly separately.

<Example> Lead wire length 2000 mm

For DC: **V114-5LO**

For AC: **V114A-1LO**

**SY100-30-4A-20** **SY100-30-1A-20**

---

**How to Use Plug Connector**

1. Attaching and detaching connectors

- To attach a connector, hold the lever and connector unit between your fingers and insert straight onto the pins of the solenoid valve so that the lever's pawl is pushed into the groove and locks.
- To detach a connector, remove the pawl from the groove by pushing the lever downward with your thumb, and pull the connector straight out.

2. Crimping of lead wires and sockets

Strip 3.2 to 3.7 mm at the end of the lead wires, insert the ends of the core wires evenly into the sockets, and then crimp with a crimping tool. When this is done, take care that the coverings of the lead wires do not enter the core wire crimping area.

Use special tool when crimping. (Consult with SMC for the crimping tool.)
Surge Voltage Suppressor

**<For DC> Grommet, L and M Plug Connector**

- **Standard type (with polarity)**
  - With surge voltage suppressor (\(\text{□}\)S)

- **Coil**

  ![Image of coil](image7)

- **How to Order**

  - **SY100-68-A**
    - **Lead wire length (L)**
      
      | L | 300 mm | 600 mm | 1000 mm | 1500 mm | 2000 mm | 2500 mm | 3000 mm | 5000 mm |
      |---|------|------|-------|-------|-------|-------|-------|-------|
      | Nil | 6    | 10   | 15    | 20    | 25    | 30    | 50     |

- **Timer circuit**

  ![Image of timer circuit](image8)

- **How to Order**

  **Connector Assembly with Cover**

  Connector assembly with protective cover enhances dust protection

  - Effective in preventing possible short circuit problems due to contaminants in contact with connector section.
  - Cover material is chloroprene rubber which has excellent weatherability and electric insulation properties. However, be careful not to allow contact with cutting oil, etc.
  - Round cord provides neat appearance.

  **How to Order**

  - **SY100-68-A**
    - **Lead wire length (L)**
      
      | L | 300 mm | 600 mm | 1000 mm | 1500 mm | 2000 mm | 2500 mm | 3000 mm | 5000 mm |
      |---|------|------|-------|-------|-------|-------|-------|-------|
      | Nil | 6    | 10   | 15    | 20    | 25    | 30    | 50     |

- **Operating Principle**

  The electrical circuit shown above allows reduced holding current consumption and measures power saving. Refer to the electrical waveform on the right.

- **Caution**

  In the case of ZNR surge voltage suppressor, note the surge voltage to be suppressed at controller side as there will be a residual voltage according to the protective element and rated voltage. Moreover, the residual voltage of the diode is approximately 1 V.

**Series 10-V100**

Specific Product Precautions 1

Be sure to read before handling.

---

**Warning**

**Manual override operation**

Since connected equipment will be actuated when the manual override is operated, first confirm that conditions are safe.

- Non-locking push type [Standard]
  - Press in the direction of the arrow.

- Locking slotted type [B]
  - Turn in the direction of the arrow.

**Caution**

**How to use plug connector**

1. **Attaching and detaching connectors**
   - To attach a connector, hold the lever and connector unit between your fingers and insert straight onto the pins of the solenoid valve so that the lever's pawl is pushed into the groove and locks.
   - To detach a connector, remove the pawl from the groove by pushing the lever downward with your thumb, and pull the connector straight out.

2. **Crimping of lead wires and sockets**
   - Strip 3.2 to 3.7 mm at the end of the lead wires, insert the ends of the core wires evenly into the sockets, and then crimp with a crimping tool. When this is done, take care that the coverings of the lead wires do not enter the core wire crimping area.
   - Use special tool when crimping. (For the crimping tool, please consult with SMC.)

---

**Caution**

**How to use plug connector**

3. **Attaching and detaching sockets with lead wires**
   - **Attaching**
     - Insert the sockets into the square holes of the connector (with + and - indication), and continue to push the sockets all the way in until they lock by hooking into the seats in the connector. (When they are pushed in, their hooks open and they are locked automatically.) Then confirm that they are locked by pulling lightly on the lead wires.
   - **Detaching**
     - To detach a socket from a connector, pull out the lead wire while pressing the socket's hook with a stick having a thin tip (approx. 1 mm). If the socket will be used again, first spread the hook outward.

---

**Plug connector lead wire length**

Standard length is 300 mm, however, the following lengths are also available.

<table>
<thead>
<tr>

</tbody>
</table>

**How to Order Connector Assembly**

- For DC: SY100-30-4A
- For 100 VAC: SY100-30-1A
- For 200 VAC: SY100-30-2A
- For other voltages of AC: SY100-30-3A

**Without lead wire:** SY100-30-A

(with connector and 2 pcs. of sockets only)

**How to Order**

Indicate part numbers of the valve without connector and the required connector assembly separately.

- Example: Lead wire length 2000 mm

**For DC:** 10-V114-5LO SY100-30-4A-20
**For AC:** 10-V114A-1LO SY100-30-1A-20
Series 10-V100 Specific Product Precautions 2
Be sure to read before handling.

Surge voltage suppressor
(For DC)
Grommet, L/M plug connector

- Standard type (with polarity)
  With surge voltage suppressor (☐S)
  Diode to prevent reverse current
  Red (+) Black (–)
  With light/surge voltage suppressor (☐Z)
  Diode to prevent reverse current
  Red (+) Black (–)
- Non-polar type
  With surge voltage suppressor (☐R)
  Varistor
  (+) (+) (–) (–)
  With light/surge voltage suppressor (☐U)
  Varistor
  (+) (+) (–) (–)

- Please connect correctly the lead wires to + (positive) and – (negative) indications on the connector.
- For DC voltages other than 12 and 24 VDC, use caution not to connect in reverse due to the absence of a diode to prevent reverse current. (Wrong polarity will cause trouble.)
- Solenoids, whose lead wires have been pre-wired: positive side red and negative side black.

- With power saving circuit
  Power consumption is reduced by approximately 75% compared with the standard product by eliminating the need for electrical current for holding. (Effective after more than 62ms energized and 24 VDC rated voltage applied.)

Working principle

The electrical circuit as shown above, allows reduced holding current consumption and measures power saving. Refer to electric waveform on the right.

- When a power saving circuit is installed, a diode to prevent reverse current is not provided. Therefore, use caution not to connect in reverse.

<For AC>
Grommet, L / M plug connectors

Connector assembly with cover

Connector assembly with protective cover enhances dust protection
- Effective in preventing possible short circuit problems due to contaminants in contact with connector section
- Cover material is chloroprene rubber which has excellent weatherability and electric insulation properties. However, be careful not to allow contact with cutting oil, etc.
- Round cord provides neat appearance.

How to Order

SY100 - 68 - A -

Connector assembly with cover / Dimensions

<Example 1> Lead wire length 2000 mm
10-V114-SL0Z-M5
SY100-68-A-20

<Example 2> Lead wire length 300 mm (Standard)
10-V114-SLPZ-M5

Symbol of connector assembly with protective cover

• No part numbers of connector assembly with cover are needed to be indicated in this case.

Caution

In the case of ZNR surge voltage suppressor, take note the surge voltage to be suppressed at controller side as there will be a residual voltage according to the protective element and rated voltage. Moreover, the residual voltage of the diode is approximately 1V.

Working principle

The electrical circuit as shown above, allows reduced holding current consumption and measures power saving. Refer to electric waveform on the right.

- When a power saving circuit is installed, a diode to prevent reverse current is not provided. Therefore, use caution not to connect in reverse.
