Stroke Reading Cylinder and Counter

Series CE

CEP1/CEU5
Resolution: 0.01 mm (Accuracy ± 0.02 mm)
Output function: RS-232C BCD
Output: 5 points (Bank switching: 20 points)
31 points (Binary output)
Achieve rationalization
Stroke reading cylinder

Measurement is possible throughout the full stroke range.

The home position can be anywhere within the cylinder stroke.

When the counter is reset by pressing the cylinder rod to the reference plane, that point becomes the home position.

System Configuration

High Precision Stroke Reading Cylinder (CEP1)
- Resolution: 0.01 mm (Accuracy ±0.02 mm)
- Special scraper now standard (IP-67)
- 2 types of seal material available (Made to Order)
- Power supply voltage 12 to 24 VDC
- Auto switch mounting orientation can be freely selected (3 mounting surfaces)

Stroke Reading Cylinder (CE1)
- Resolution: 0.1 mm (Accuracy ±0.2 mm)
- Water resistance improved by changing the sensor unit filler.
- Power supply voltage 12 to 24 VDC
- Abundant stroke variations
- Improved noise resistance

Note) Detection with resolution of 0.01 mm is not possible with a combination between Series CEP1 and CEU1.
Tolerances of preset values can be set. (CEU1, CEU5)

Tolerances can be set for preset values.  
CEU1: ± set tolerance  
CEU5: + set tolerance, – set tolerance (separate settings)

**Simple operation**

**Multi-counter (CEU5)**
- Output terminal: 5 points  
- Number of output settings: 20 points (Bank switching) 31 points (Binary output)  
- Communication function with RS-232C  
- With BCD output (Option)  
- Maximum counting speed 100 kHz  
- Prescale function  
- With multiplication switching (1, 2, 4 multiplication)  
- DIN rail mountable  
- 6 digits count display

Includes all functions of the CEU1.

**3-point Preset Counter (CEU1)**
- Output terminal: 3 points  
- DIN rail mountable  
- Hold output, Comparison output, One shot output

**Series Variations**

**Series CE1**

10-12-3
Application Example

**Parts inspection**
- Measures the dimensions of parts, discriminates between good and defective articles, and prevents the mingling of different parts, etc.

**Confirmation of press-in**
- Can confirm the press-in of a hydraulic cylinder by detecting its stroke.
- Even if the size of the workpiece changes, the point of press-in completion can be easily changed.

**Detection of die assembly's deceleration point**
- Since the deceleration point of the die assembly can be set at will, it can be easily changed after replacement of the die assembly.

**Discrimination of direction**
- Maintains a constant height of measuring workpiece height.

**Length/breadth discrimination**
- Distinguishes either lengthwise or crosswise while correcting the position of a workpiece.

**Detection of lifter position**
- Can continuously monitor a lifter's stroke.

**Inspection of machined holes**
- Can detect machined hole depth, burrs and foreign matter, etc.

**Nozzle height adjustment**
- Maintains a certain height of a workpiece and a nozzle by measuring the height of a workpiece.

**Measurement of dimensions**
- Can measure dimensions of parts.

**Measurement of machining dimensions**
- Performs adjustment of machining depth, etc. by measuring the part dimensions before machining.
Measurement Principle

The amount of rod movement in the stroke reading cylinder is detected using an MR element (magnetic resistance element) whose resistance value changes due to magnetic force. The detection unit containing this MR element is called the sensor head. An amplifying circuit and a dividing circuit are required to produce output which can be read by the counter, and these are attached to the cylinder case. The sensor head and amplifier section together are referred to as the sensor unit.

Sensor unit

Amplifier section

Sensor head

Cylinder unit

Magnetic scale rod

The stroke reading cylinder is equipped with the capability of outputting the piston stroke movement as a pulse signal. The measurement principle is as shown in the drawing below.

A/B Phase Difference Output (90° phase difference output)

When movement is expressed by a single line of pulses, it is impossible to accurately identify the current position, because pulse waves appear in both upward and downward directions. Accordingly, in A/B phase difference output, two lines of pulses are provided, wherein one line detects the movement and the other distinguishes the direction. The CE1 also employs this system.

Signal (1)

Signal (2)

Counting Speed (kHz, kcps)

Counting speed indicates the number of pulses that can be counted per second. If the stroke reading cylinder is operated at high speeds, pulse waves are output in shorter cycles. The counting speed of the counter must be higher than the pulse speed for the maximum piston speed when operating. Since the stroke reading cylinder outputs one pulse for each 0.1 mm of movement, 5,000 pulses will be output for each 500 mm of movement. Therefore, a speed of 500 mm/s is equivalent to 5 kcps (kHz), but a counting speed 2 to 3 times greater is recommended for actual operation.

Repeatability

The accuracy is the difference between the dimensions based upon the signals of the stroke reading cylinder and the absolute dimensions. The maximum display error that will appear on the counter's digital display is equal to twice (±1 count) the resolution when the home position is reset and when dimensions are measured.
## Series CE
### Specific Product Precautions

**Be sure to read before handling.**

---

### Mounting

**Caution**

1. When screwing a nut or fitting, etc. onto the threaded section at the end of the piston rod, return the piston rod to its fully retracted position, and grasp the exposed portion of the rod across two parallel sides with a wrench. In the case of the high precision stroke reading cylinder, there are no parallel sides. Secure the workpiece with a double nut.

   **Note** Do not apply rotational torque to the piston rod.

2. Operate the cylinder in such a way that the load is always applied in the axial direction.
   - In case the load is applied in a direction other than the axial direction of the cylinder, provide a guide to constrain the load itself.
   - When mounting a cylinder, centering should be done carefully.

3. Avoid using the air cylinder in such a way that rotational torque would be applied to the piston rod.

4. Be careful to avoid scratches or dents, etc. on the sliding sections of the piston rod.

### Sensor Unit

1. The sensor unit is adjusted to an appropriate position at the time of shipment. Therefore, never detach the sensor unit from the body.

2. The cylinder should be protected from contact with liquids such as coolants or coolant water. (CE1)

3. The sensor cable should not be pulled with a strong force.

4. Since the sensor for stroke reading cylinder adopts the magnetic method, it may result in malfunction if there is a strong magnetic field around the sensor. Use it under the external magnetic field with 14.5 mT or less.

   This is equivalent to a magnetic field of approximately 18 cm in radius from a welding area using a welding amperage of almost 15,000 amperes. To use the system in a magnetic field that exceeds this value, use a magnetic material to shield the sensor unit.

5. Switches or relays, etc. should not be installed in the power supply line (12 to 24 VDC).

---

### Effects of Noise

**Caution**

When the stroke reading cylinder is used near a motor, welding machine or other source of noise generation, there is a possibility of miscounting. In this case, noise should be suppressed as much as possible and the following countermeasure should be taken.

1. Connect the shield wire to FG (flame ground).

2. The maximum transmission distance for the stroke reading cylinder is 23 m, but since the output signal is a pulse output, the sensor cable should be wired separately from other power lines.

### Noise Counter Measures

Methods of dealing with noise are given below.

1. Connect only the shield wire to FG (frame ground).

2. Use a power source separate from large motors and AC valves, etc.

3. Run the stroke reading cylinder’s cable away from other power lines.

4. Install a noise filter in the 100 VAC power line, and install a varistor in the DC power supply of the sensor cable.

### Counter speed of counter

When the speed of the stroke reading cylinder is greater than the counting speed of the counter, the counter will miscount. For CE1 (when measuring to 0.1 mm), a counter should be used with a counting speed of 10 kHz (kcps) or more. And for CEP1 (when measuring to 0.01 mm), use a counter with a counting speed of 50 kHz (kcps) or more when 4 times multiplication is input.

### Malfunction due to lurching and bounding

When lurching or bounding occurs at the beginning or end of stroke reading cylinder, or due to other causes, the cylinder speed momentarily increases, and there is a possibility of exceeding the counting speed of the counter or the response speed of the sensor, thereby causing a miscount.

---

### Handling of Technical Material

The instruction manuals should be read before using the Series CEP1 high precision stroke reading cylinder, CEU5 multi counter, CE1 scale cylinder and CEU1 3 point preset counter.

Proper Auto Switch Mounting Position

Regarding dimensions for the proper auto switch mounting position (at stroke end), refer to page 10-12-16.

Electrical Wiring

Output type
The output signal of the high precision stroke reading cylinder is A/B phase difference output (open collector output) as shown in the figure below. The relation between the movement distance and the signal output of the high precision stroke reading cylinder is that for each 0.04 mm of movement a one pulse signal is output to both output terminals A and B. In order to measure with a discrimination of 0.01 mm, a counter with a 4 times multiplication function (CEU5) is required.

Input/Output
The input/output of the stroke reading cylinder is performed by a ø7 shielded twisted pair wire from the sensor section plus a connector.

  - 50: 50 mm
  - 63: 63 mm

- **Auto switch**
  - Without auto switch
  - With auto switch
    - For the applicable auto switch model, refer to the table below.
    - Auto switches are shipped together, (but not assembled).

- **Connector**
  - Without connector
  - With connector

### Applicable Auto Switch

For page 10-20-1 for further information on auto switches.

#### Load voltage
- DC: 5 V, 12 V
- AC: 200 V

#### Load wire length (m)
- 0.5
- 3
- 5
- None

#### Applicable load
- IC circuit
- Relay, PLC

---

### Standard cylinder stroke (mm)
Ref to “Standard Stroke” on page 10-12-19.

### Extension cable

#### Cable length
- 5 m
- 10 m
- 15 m
- 20 m

### Suffix for cylinder
- Without auto switch
- With auto switch
  - For the applicable auto switch model, refer to the table below.
  - Auto switches are shipped together, (but not assembled).

#### Suffix
- Extension cable
- Extension cable & connector

---

### Applicable Auto Switch

Refer to page 10-20-1 for further information on auto switches.

### Electrical Wiring

#### Output type

The output signal of the stroke reading cylinder is A/B phase difference output (open collector output) as shown in the figure below.

The relation between the movement distance and the signal output of the stroke reading cylinder is that for each 0.1 mm of movement a one pulse signal is output to both output terminals A and B.

Furthermore, the maximum response speed of the sensor for the stroke reading cylinder is at a maximum cylinder speed of 1500 mm/s (15 kcps).

#### Input/Output

The input/output of the stroke reading cylinder is performed by a ø7 shielded twisted pair wire from the sensor section plus a connector.

#### Signal

**Connector pin arrangement**

![Connector pin arrangement](image)
**Construction**

For ø12, ø20:

1. Cylinder body: Aluminum alloy
2. Rod cover: Brass
3. Head cover: Aluminum alloy
4. Piston: Aluminum alloy
5. Piston rod: Stainless steel
6. Rod cover disk: Aluminum alloy
7. Sensor unit: —
8. Sensor setting bracket: Stainless steel
9. Sensor setting piece assembly: —
10. Pin: Stainless steel
11. Sensor guide: Lead-bronze casted
12. Case setting nut: Carbon steel
13. Cushion ring A: Rolled steel
14. Cushion ring B: Rolled steel
15. Cushion valve: —
16. Piston nut: Rolled steel
17. Port joint: Stainless steel

For ø32:

1. Cylinder body: Aluminum alloy
2. Rod cover: Brass
3. Head cover: Aluminum alloy
4. Piston: Magnetic material
5. Piston rod: Stainless steel
6. Rod cover disk: Aluminum alloy
7. Sensor unit: —
8. Sensor setting bracket: Stainless steel
9. Sensor setting piece assembly: —
10. Pin: Stainless steel
11. Sensor guide: Lead-bronze casted
12. Case setting nut: Carbon steel
13. Cushion ring A: Rolled steel
14. Cushion ring B: Rolled steel
15. Cushion valve: —
16. Piston nut: Rolled steel
17. Port joint: Stainless steel

For ø40 to ø63:

1. Wear ring: Resin
2. Rod end nut: Carbon steel
3. Sensor setting plate: Cold rolled special steel strip
4. Type C snap ring: Carbon steel
5. Magnet: —
6. Round head Phillips screw: Carbon steel wire
7. Cross recessed countersunk head screw: Carbon steel wire
8. Hexagon socket head cap screw: Chromium molybdenum steel
9. Spring washer: Steel wire
10. Case gasket: NBR
11. Case screw gasket: NBR
12. Piston seal: NBR
13. Rod seal: NBR
14. Gasket: NBR
15. Cushion seal: NBR
16. Piston gasket: NBR
17. Port seal: NBR
18. Joint seal: NBR
19. Valve seal: NBR
20. Valve retainer seal: NBR

*Since there is a possibility of improper operation, please contact SMC regarding the replacement of seals.*

Series CEU/Series CE
Counter/Extension Cable

- Multi-counter

How to Order
CEU5

Output transistor mode
- Nil: NPN open collector output
- P: PNP open collector output

Power supply voltage
- Nil: 100 to 240 VAC
- D: 24 VDC

External output
- Nil: RS-232C
- B: RS-232C + BCD

Connection Method

High precision stroke reading cylinder

If the distance between high precision stroke reading cylinder and multi-counter is over 23 meter, use transmission box. (CE1-H0374)

BCD Connector Specifications
Model (counter side):
DX10M-36S (made by Hirose Electric Co., Ltd.)
Connector model:
DX30AM-36P (made by Hirose Electric Co., Ltd.)

Please consult with SMC separately for a BCD cable with connector.

</table>

*1) 90° phase difference input

*2) UP/DOWN input

Input wave form conditions: At a maximum of 100 kHz, the UP/DOWN wave form should be as shown below.

UP pulse: +12 V ±10%
DOWN pulse: +12 V ±10%

2.5 µsec or more required

Counting speed \( f = \frac{1}{t} = \frac{1}{10 \times 10^{-6}} = 100000 \text{ Hz} \)

*3) 15 mA when BCD is output.

## Multi-counter/Dimensions

![Multi-counter Dimensions](image-url)
Wiring with External Equipment

1. Wiring of power source for driving counter
   For power source for driving counter, use the one
   with 90 to 264 VAC, 50/60 Hz or 21.6 to 264
   VDC, 0.4 A or more.

2. Wiring for control signal input
   (Selection among Reset, Hold, Bank)
   Make each control signal to be the transistor
   which can run more than 15 mA or the contact
   output. Input time for reset signal should be more
   than 10 ms. Bank selection and hold will function
   only when the input signal is applied.
   COM is common to each signal input. Applicable
   to NPN and PNP input. Use 24 VDC or 12 VDC
   for the power source of COM. Connect DC−
   when PNP is applied, and DC+ when NPN is
   applied.

3. Output circuit
   There are two outputs, the NPN open collector and the PNP open collector.
   The maximum rating is 30 VDC, 50 mA. Operating the controller by exceeding this voltage
   and amperage could damage the electric circuit.
   Therefore, the equipment to be connected must be below this rating.

<table>

<th>CEU5-□-□</th>
<th>CEU5P-□-□</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection method</td>
<td>NPN transistor output</td>
<td>PNP transistor output</td>
</tr>
</tbody>
</table>

   * However, the COM of the input circuit and the COM of the output circuit are electrically insulated
   from each other.
**Series CEU1**

### 3-point Preset Counter

#### How to Order

**CEU1**

- **Counter drive power supply**
  - Nil: 100 VAC
  - D: 24 VDC

- **Output mode selection**
  - Nil
  - P: NPN open collector output
  - D: PNP open collector output

#### Connection Method

**Stroke reading cylinder**

Anti-noise performance will be improved by placing varistor, noise filter as a figure at right.

Shielding should be connected to FG (frame ground). If sources of noise generation (motors, AC type valves, relays, etc.) are connected on the secondary side of the noise filter, the filter will have no effect.

When the distance between stroke reading cylinder and counter is over 23 m, use a transmission box (CE1-H0374).

</tbody>
</table>

In the explanations of the operating method, references to “Direction keys” indicate the 4 keys RIGHT, LEFT, UP and DOWN.
1. Explanation of display in count mode
   - Normal output display
     - Displays current output bank
     - Displays output state of each OUT terminal
   - Binary output display
     - Displays only when matched with preset
   - Setting the upper limit tolerance
     - Set numerical values in the same way with the direction keys.
     - When ± is selected, the lower limit display is cleared and ± setting is possible.
     - Shift to the next item with the SEL. key.
   - Setting the lower limit tolerance
     - Set numerical values in the same way with the direction keys.
     - When ± is selected in the upper limit setting, this item is not displayed.
     - Shift to the next item with the SEL. key.
   - Setting the output configuration
     - Switch to 1SHOT, HOLD or COMPARE with the UP/DOWN keys.
     - Store the setting with the SET key.
     - The SEL. key only shifts to another item without storing the setting.

2. Setting of preset mode
   - Selection of preset No.
     - Select a preset number from 1 to 31 with the UP/DOWN keys.
     - Shift to the next item with the SEL. key.
   - Setting the preset values
     - Shift the digits with the LEFT/RIGHT keys, and increase or decrease the numerical values with the UP/DOWN keys.
     - Shift to the next item with the SEL. key.
   - Setting the upper limit tolerance
     - Set numerical values in the same way with the direction keys.
     - When ± is selected, the lower limit display is cleared and ± setting is possible.
     - Shift to the next item with the SEL. key.
   - Setting the lower limit tolerance
     - Set numerical values in the same way with the direction keys.
     - When ± is selected in the upper limit setting, this item is not displayed.
     - Shift to the next item with the SEL. key.
   - Setting the output configuration
     - Switch to 1SHOT, HOLD or COMPARE with the UP/DOWN keys.
     - Store the setting with the SET key.
     - The SEL. key only shifts to another item without storing the setting.
3. Explanation of settings in the function mode

If the UP/DOWN keys are pressed when an item name is flashing, it shifts to another setting item. When the SEL. key is pressed, the cursor shifts and it is possible to change the content of the setting for the item which is being displayed.

### Prescale
- **Selection of connected model**
  - Select CEP1, CE1 or manual with the UP/DOWN keys.
  - Select CEP1, CE1: Store the setting with the SET key and return to (1).
  - Select manual: Shifts to the next item when the SEL. key is pressed.
- **Setting the multiplication function**
  - Select x1, x2 or x4 with the UP/DOWN keys.
  - x4 indicates multiplication by 4.
  - Shift to the next item with the SEL. key.

**Setting the prescale value**
- Set the number to be added for each count.
- Shift the digits with the LEFT/RIGHT keys, and increase or decrease the numerical values with the UP/DOWN keys.
- Shift to the next item with the SEL. key.

**Setting the decimal point position**
- Shift the position of the decimal point with the LEFT/RIGHT keys.
- Store the setting with the SET key.
- The SEL. key only shifts the cursor without storing the setting.

### Offset
- **Selection of connected model**
  - Select CEP1, CE1 or manual with the UP/DOWN keys.
  - Select CEP1, CE1: Store the setting with the SET key and return to (1).
  - Select manual: Shifts to the next item when the SEL. key is pressed.

**Setting the multiplication function**
- Select x1, x2 or x4 with the UP/DOWN keys.
  - x4 indicates multiplication by 4.
  - Shift to the next item with the SEL. key.

**Setting the prescale value**
- Set the number to be added for each count.
- Shift the digits with the LEFT/RIGHT keys, and increase or decrease the numerical values with the UP/DOWN keys.
- Shift to the next item with the SEL. key.

**Setting the decimal point position**
- Shift the position of the decimal point with the LEFT/RIGHT keys.
- Store the setting with the SET key.
- The SEL. key only shifts the cursor without storing the setting.
The setting mode for stand-by time until stop output is commanded is selected by pressing the SEL key while STOP is flashing.

Set numerical values with the direction keys. The unit is 0.1 sec. Store the setting with the SET key. The SEL key only shifts the cursor without storing the setting.

The output system setting mode is selected by pressing the SEL key while OUTPUT is flashing.

Select normal output or binary output with the UP/DOWN keys. Store the setting with the SET key. The SEL key only shifts the cursor without storing the setting.

The input type setting mode is selected by pressing the SEL key while INPUT is flashing.

Select phase difference input with the UP/DOWN keys (2PHASE) or separate input (UP/DOWN) with the UP/DOWN keys. Store the setting with the SET key. The SEL key only shifts the cursor without storing the setting.

The count value backup setting mode is selected by pressing the SEL key while BACKUP is flashing.

Select ON or OFF with the UP/DOWN keys. Store the setting with the SET key. The SEL key only shifts the cursor without storing the setting.

The RS-232C communication speed setting mode is selected by pressing the SEL key while RS-232 is flashing.

Select the communication speed from 1200, 2400, 4800, 9600 or 19200 with the UP/DOWN keys. Store the setting with the SET key. The SEL key only shifts the cursor without storing the setting.

The unit number registration mode is selected by pressing the SEL key while UNIT is flashing.

Set numerical values with the direction keys. Settings can be made from 00 to 99. Store the setting with the SET key.
CEU1 Operation

Key and Functions

<table>
<thead>
<tr>

</tbody>
</table>

The counter mode changes in the order shown below each time the [MODE] key is pressed.

- **Count mode**
- **Preset data input**
- **Allowable value input**
- **Input of output configuration**
- **LCD display**
  - SET 1
  - SET 2
  - SET 12 is not displayed.
**Count mode**

This is the mode when the counter is being operated. When the power is turned on, this mode is automatically selected.

**Preset data input**

The minus sign appears at the far left side. There is no indication for positive numbers.

Flashes during setting. Flashing cursor

The location with the flashing cursor is the object of operation. Shift the digits with the [SHIFT] key and increase numerical values with the [DATA] key.

Each time the [SEL] key is pressed, the setting object changes in the order OUT1 → OUT2 → OUT3.

Store the changed content with the [SET] key. If the [SET] key is not pressed, the changed content will not be valid.

The location with the flashing cursor is the object of operation. Shift the digits with the [SHIFT] key and increase numerical values with the [DATA] key.

Store the changed content with the [SET] key. If the [SET] key is not pressed, the changed content will not be valid.

Store the changed content with the [SET] key. If the [SET] key is not pressed, the changed content will not be valid.

This changes with the [DATA] key in the order.

• Output terminals 1 through 3 can be set separately.
• In the model CEU1, the allowable value is a ± value.

(Only the model CEU5 is equipped with a function to set different values for the upper and lower limits.)
**Series CE**

**Glossary (Functions of CEU5)**

**BCD Output**

This is a system which expresses one digit of a decimal number with a 4 digit binary number. The count value is expressed by the ON/OFF state of each BCD output terminal. In the case of 6 digits, 24 terminals are required.

The relation between decimal numbers and BCD codes is shown in the table below.

<table>
<thead>
<tr>
<th>Decimal no.</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>

<td>0110</td>
<td>0111</td>
<td>1000</td>
<td>1001</td>
</tr>
</tbody>
</table>

Ex.) 1294.53 is expressed as follows.
0001 0010 1001 0100 0101 0011

**RS-232C**

This is the interface standard for the serial transmission method, which is standard equipment on a personal computer.

**Prescale Function**

This function allows free setting of how many millimeters will indicate one pulse.

**Binary Output**

31 point preset output is possible without bank switching, by means of binary system output from a 5 point output terminal. Cylinder stop output is used as the readout release signal.

The coincident preset number is expressed as a 5 digit binary number.

**Bank Function**

5 points of preset output are possible simultaneously, however, a maximum of 20 types of work discrimination, etc. can be performed by using the 5 points of preset values as one of a maximum of four quadrats, and switching its use during operation.

For example, when bank 2 is selected, presets 6 through 10 are valid and when the count value coincides with preset no. 6 through 10, the respective output terminals 1 through 5 are turned ON.

**Bank Switching Correspondence**

<table>

</tbody>
</table>

The coincident preset number is expressed as a 5 digit binary number.
Display Offset Function
Normally the count value returns to “0” after resetting, but with this function, the initial value can be set to any desired value.

Hold Function
When “hold” is input, the counter holds the current count value in memory. Next, when the count value is read into a PLC which uses serial or BCD output, etc., the count value that was held can be read in, even if there is a time lag.

Setting the Tolerances of Preset Values
In the current model CEU1, the preset value tolerances could only be set as ±, but now it has become possible to set an upper and lower limit of +△ mm and −△ mm.

By including preset tolerance setting, superior performance is exhibited in parts inspections, etc. In a workpiece to be measured, there are tolerances which assure a good product. For example, in the case of $10 \pm 0.02$, the CEU5 allows these tolerances to be input as they stand. If the workpiece is within tolerances the OK signal is sent.

On the other hand, in ordinary counters, no. 1 is set to 9.98 and no. 2 is set to 10.06, and if no. 1 is ON and no. 2 is OFF, an acceptance decision is made. 2 points of output are used in order to check whether or not the product is within dimension tolerances.

In this example, one preset of the CEU5 performs the same function as two presets of an ordinary counter.

Count Value Protection
In the past, the count value returned to “0” when the power supply was cut off, but this function holds the previous value even after a power failure. This function can be switched between active and inactive settings.

Cylinder Stop Output
When workpiece discrimination is performed using a preset counter, it has been common to estimate the amount of time from the cylinder’s start of operation until it touches the workpiece and stops, using a timer to read the output after a fixed amount of time. Since cylinder stop output is now output when there is no cylinder movement for a fixed amount of time, timing of preset output and external output, etc. is simplified.
