Safety Instructions

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of "Caution", "Warning" or "Danger". They are all important notes for safety and must be followed in addition to International standards (ISO/IEC)*1 and other safety regulations.

*1) ISO 4414: Pneumatic fluid power -- General rules relating to systems
    ISO 4413: Hydraulic fluid power -- General rules relating to systems
    IEC 60204-1: Safety of machinery -- Electrical equipment of machines (Part 1: General requirements)
    ISO 10218-1: Manipulating industrial robots -Safety.
    etc.

⚠️ Caution ⚠️
CAUTION indicates a hazard with a low level of risk which, if not avoided, could result in minor or moderate injury.

⚠️ Warning ⚠️
WARNING indicates a hazard with a medium level of risk which, if not avoided, could result in death or serious injury.

⚠️ Danger ⚠️
DANGER indicates a hazard with a high level of risk which, if not avoided, will result in death or serious injury.

⚠️ Warning ⚠️

1. The compatibility of the product is the responsibility of the person who designs the equipment or decides its specifications.
   Since the product specified here is used under various operating conditions, its compatibility with specific equipment must be decided by the person who designs the equipment or decides its specifications based on necessary analysis and test results. The expected performance and safety assurance of the equipment will be the responsibility of the person who has determined its compatibility with the product. This person should also continuously review all specifications of the product referring to its latest catalog information, with a view to giving due consideration to any possibility of equipment failure when configuring the equipment.

2. Only personnel with appropriate training should operate machinery and equipment.
   The product specified here may become unsafe if handled incorrectly. The assembly, operation and maintenance of machines or equipment including our products must be performed by an operator who is appropriately trained and experienced.

3. Do not service or attempt to remove product and machinery/equipment until safety is confirmed.
   1. The inspection and maintenance of machinery/equipment should only be performed after measures to prevent falling or runaway of the driven objects have been confirmed.
   2. When the product is to be removed, confirm that the safety measures as mentioned above are implemented and the power from any appropriate source is cut, and read and understand the specific product precautions of all relevant products carefully.
   3. Before machinery/equipment is restarted, take measures to prevent unexpected operation and malfunction.

4. Contact SMC beforehand and take special consideration of safety measures if the product is to be used in any of the following conditions.
   1. Conditions and environments outside of the given specifications, or use outdoors or in a place exposed to direct sunlight.
   2. Installation on equipment in conjunction with atomic energy, railways, air navigation, space, shipping, vehicles, military, medical treatment, combustion and recreation, or equipment in contact with food and beverages, emergency stop circuits, clutch and brake circuits in press applications, safety equipment or other applications unsuitable for the standard specifications described in the product catalog.
   3. An application which could have negative effects on people, property, or animals requiring special safety analysis.
   4. Use in an interlock circuit, which requires the provision of double interlock for possible failure by using a mechanical protective function, and periodical checks to confirm proper operation.
Caution

The product is provided for use in manufacturing industries. The product herein described is basically provided for peaceful use in manufacturing industries. If considering using the product in other industries, consult SMC beforehand and exchange specifications or a contract if necessary. If anything is unclear, contact your nearest sales branch.

Limited warranty and Disclaimer/Compliance Requirements

The product used is subject to the following "Limited warranty and Disclaimer" and "Compliance Requirements". Read and accept them before using the product.

Limited warranty and Disclaimer

1. The warranty period of the product is 1 year in service or 1.5 years after the product is delivered. Also, the product may have specified durability, running distance or replacement parts. Please consult your nearest sales branch.
2. For any failure or damage reported within the warranty period which is clearly our responsibility, a replacement product or necessary parts will be provided. This limited warranty applies only to our product independently, and not to any other damage incurred due to the failure of the product.
3. Prior to using SMC products, please read and understand the warranty terms and disclaimers noted in the specified catalog for the particular products.

   *2) Vacuum pads are excluded from this 1 year warranty.
   A vacuum pad is a consumable part, so it is warranted for a year after it is delivered.
   Also, even within the warranty period, the wear of a product due to the use of the vacuum pad or failure due to the deterioration of rubber material are not covered by the limited warranty.

Compliance Requirements

1. The use of SMC products with production equipment for the manufacture of weapons of mass destruction (WMD) or any other weapon is strictly prohibited.
2. The exports of SMC products or technology from one country to another are governed by the relevant security laws and regulation of the countries involved in the transaction. Prior to the shipment of a SMC product to another country, assure that all local rules governing that export are known and followed.
Operator

- This operation manual is intended for those who have knowledge of machinery using pneumatic equipment, and have sufficient knowledge of assembly, operation and maintenance of such equipment. Only those persons are allowed to perform assembly, operation and maintenance.
- Read and understand this operation manual carefully before assembling, operating or providing maintenance to the product.

Safety Instructions

⚠️ Warning

- Do not disassemble, modify (including changing the printed circuit board) or repair. An injury or failure can result.

- Do not operate the product outside of the specifications. Do not use for flammable or harmful fluids. Fire, malfunction, or damage to the product can result. Verify the specifications before use.

- Do not operate in an atmosphere containing flammable or explosive gases. Fire or an explosion can result. This product is not designed to be explosion proof.

- Do not use the product in a place where static electricity is a problem. Otherwise it can cause failure or malfunction of the system.

- If using the product in an interlocking circuit:
  - Provide a double interlocking system, for example a mechanical system
  - Check the product regularly for proper operation Otherwise malfunction can result, causing an accident.

- The following instructions must be followed during maintenance:
  - Turn off the power supply
  - Stop the air supply, exhaust the residual pressure and verify that the air is released before performing maintenance. Otherwise an injury can result.

⚠️ Caution

- Do not touch the terminals and connectors while the power is on. Otherwise electric shock, malfunction or damage to the product can result.

- After maintenance is complete, perform appropriate functional inspections and leak tests. Stop operation if the equipment does not function properly or there is a leakage of fluid. When leakage occurs from parts other than the piping, the product might be faulty. Disconnect the power supply and stop the fluid supply. Do not apply fluid under leaking conditions. Safety cannot be assured in the case of unexpected malfunction.
≥NOTE≥

Follow the instructions given below when designing, selecting and handling the product.

● The instructions on design and selection (installation, wiring, environment, adjustment, operation, maintenance, etc.) described below must also be followed.

● Product specifications
  • Use the specified voltage.
    Otherwise failure or malfunction can result.
    Insufficient supply voltage may not drive a load due to a voltage drop inside the Air Catch Sensor.
    Please use the following formula, after verify the operating voltage of the load
    \[ \text{Power voltage} - \text{Internal drop voltage} > \text{Load operating voltage} \]
  • Use the specified measurement flow rate and operating pressure.
    Otherwise it can cause damage to the Pressure switch or inability to measure correctly.
  • Do not exceed the specified maximum allowable load.
    Otherwise it can cause damage or shorten the lifetime of the Pressure switch.
  • Do not use a load which generates surge voltage.
    When a surge-generating load such as a relay or solenoid is driven directly, use a Pressure switch with a built-in surge absorbing element.
  • Quality of operating air
    1. Use clean air.
      Do not use a fluid containing chemicals, synthetic oils including organic solvent, salt and corrosive gases.
      Otherwise, damage to the product and malfunction can result.
    2. Install an air filter.
      Install the air filter at the upstream side to the valve. Filtration degree should be 5 μm or less.
    3. Install an air dryer, after cooler, etc.
      If compressed air containing condensate is used, install an air dryer or drain catch before the filter and perform drainage regularly.
  • Reserve a space for maintenance
    Allow sufficient space for maintenance when designing the system.

● Product handling

● Installation
  • Tighten to the specified tightening torque.
    If the tightening torque is exceeded the mounting screws and brackets may be broken.
    If the tightening torque is insufficient, the product can be displaced and loosen the mounting screws.
    Recommended proper torque (Rc, NPT, G) is as below,
    Connecting thread is 1/8 Torque is 7 to 9 Nm
    Connecting thread is 1/4 Torque is 12 to 14 Nm
  • Eliminate any dust left in the piping by air blow before connecting the piping to the product.
    Otherwise it can cause damage or malfunction.
  • Clean the inside of the pipe of dust or tape sealant when screwing pipes or joints.
    When using tape sealant, leave a couple of screw threads unwrapped with tape sealant.
  • Do not insert metal wires or other foreign matter into the pressure measurement port.
    It can damage the pressure sensor causing failure or malfunction.
Wiring
• Avoid repeatedly bending or stretching the lead wire, or placing heavy load on them.
  Repetitive bending stress or tensile stress can cause the sheath of the wire to peel off, or breakage of the wire.
  Replace the damaged lead wire with a new one.
• Wire correctly.
  Incorrect wiring can break the Pressure switch.
• Do not short-circuit the load.
  Pay special attention when connecting the positive power supply wire (Brown) and the output wire (Black).
• Do not route wires and cables together with power or high voltage cables.
  Otherwise the product can malfunction due to interference of noise and surge voltage from power and high voltage cables to the signal line. Route the wires (piping) of the product separately from power or high voltage cables.
• Confirm proper insulation of wiring.
  Poor insulation (interference from another circuit, poor insulation between terminals, etc.) can lead to excess voltage or current being applied to the product, causing damage.

Environment
• The enclosure of the switch conforms to IP66 and that for the solenoid valve to IP65. The pressure gauge and the regulator have open constructions. Take poorer protection measures in an environment where water splashes, oil or spatters from welding may adhere to the product.
• Do not operate in locations having an atmosphere of flammable, explosive or corrosive gases, which can result in fire, explosion or corrosion. The Air Catch Sensor does not have an explosion proof rating.
• Do not use in an area where surges are generated.
  If there is equipment which generates a large amount of surge (solenoid type lifter, high frequency induction furnace, motor, etc.) close to the Pressure switch, this may cause deterioration or breakage of the internal circuit of the Pressure switch. Avoid sources of surge generation and crossed lines.
• Mount the product in a place that is not exposed to vibration or impact.
  Otherwise failure or malfunction can result.
• Please consult with SMC if the product is to be energized continuously for long periods of time.
• Keep within the specified fluid and ambient temperatures range.
  The fluid and ambient temperatures is 0 to 60 °C. Operation under low temperature (5 °C or less) leads to cause damage or operation failure due to frozen moist in the fluid or air.
  Otherwise malfunction can result.
  Protection against freezing is necessary. Air dryer is recommended for elimination of drain and water.
  Avoid sudden temperature change even within specified temperature.
• Do not operate close to a heat source, or in a location exposed to radiant heat.
  Otherwise malfunction can result.

Maintenance
• Turn off the power supply, stop the supplied air, exhaust the residual pressure and verify the release of air before performing maintenance.
  There is a risk of unexpected malfunction.
• Do not use solvents such as benzene, thinner etc. to clean the Pressure switch.
  They could damage the surface of the body and erase the markings on the body.
  Use a soft cloth to remove stains. For heavy stains, use a cloth soaked with diluted neutral detergent and fully squeezed, then wipe up the stains again with a dry cloth.
Precautions (Air Catch Sensor ISA2 Series)

Product handling

Installation
- If the detection nozzle is exposed to splashes of water or cutting oil, do not allow backflow from the detection nozzle to the switch body. Install the switch body at a position higher than the detection nozzle wherever possible.
- In the piping between the switch body and the detection nozzle, do not use equipment or fittings that can possibly cause leakage or serve as resistance.
- Do not use One-touch fittings in an environment where the Air Catch Sensor is exposed to water or other liquid.
- Since steel piping lacking flexibility is easily affected by moment loads or propagation of vibration, employ flexible tubing, etc., to prevent interactions of such factors.

Environment
- When an Air Catch Sensor is contained in a box, provide an air outlet to constantly keep the atmospheric pressure inside the box. Internal pressure rises will hinder normal air discharge and may lead to possible malfunction.
- The air outlet is provided on the setting dial section of the Air Catch Sensor. Do not turn off air supply to the switch if water or cutting oil splashes around the setting dial.
- Since the orifice of the Air Catch Sensor is small, prevent foreign matter from entering the equipment. For this purpose, use supply air that is dry and filtered 5 mm or better.
- Since the product adopts a semiconductor pressure sensor, keep the operating pressure not larger than 0.2 MPa.
- Although CE accredited, this Air Catch Sensor is not equipped with surge protection against lightning. Necessary counter-measures for possible lightning surge should be fitted to system components as required.

Precautions (2 Port Solenoid Valve VCA Series)

The instructions on design and selection
- Take special precautions if a resistor is used in parallel with the switching element or a C-R element (for surge voltage protection) is used for protection of the switching element. The valve may fail to turn off due to leakage current flowing through the resistor or C-R element.

\[
\begin{align*}
\text{AC coil:} & \quad 10\% \text{ or less of rated voltage} \\
\text{DC coil:} & \quad 2\% \text{ or less of less of rated voltage}
\end{align*}
\]

Product handling

Installation
- Do not use the Air Catch Sensor if the leakage amount increases or the equipment does not operate properly.
- After installation, connect compressed air and electricity and conduct an appropriate functionality inspection to confirm that the Air Catch Sensor is installed properly.
- Do not apply external force to the coil.
- Apply a wrench to the exterior surface of the piping joint at the time of tightening.
- Do not use heat insulators, etc. to keep the temperature at the coil assembly.
- Do not use a tape heater for freeze prevention except on the piping and body. If may cause the coil to burn.
• Wiring
  • Used electrical wires with a conductive sectional area of 0.5 to 1.25 mm². Make sure that no excessive force is applied to the wires.
  • Adopt an electrical circuit which will not cause chattering at the contact.
  • The voltage variation must stay within the -10 to +10% range of the rated voltage. In case importance is attached to response characteristics due to use of a DC power source, keep the variation within the -5 to +5% range. The voltage drop is the value at the lead wire to which the coil is connected.
**Electrical connection for solenoid valve**

**DIN connector**

Since internal connections are as below for the DIN connector, make connections to the power supply accordingly.

<table>
<thead>
<tr>
<th>Terminal No.</th>
<th>1</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIN terminal</td>
<td>+</td>
<td>−</td>
</tr>
</tbody>
</table>

∗ There is no polarity.

- Use compatible heavy duty cords with cable O.D. φ6 to 12.
- Use the tightening torque below for each section.

![Diagram of DIN connector](image)

**Conduit terminal**

In the case of the conduit terminal, make connections according to the marks shown below.

- Use the tightening torque below for each section.
- Properly seal the terminal connection (G1/2) with the special wiring conduit, etc.

![Diagram of conduit terminal](image)
• **Maintenance**
  • Perform regular maintenance and inspections. There is a risk of unexpected malfunction.
  • Perform valve switching at least every 30 days to prevent malfunction. Also, conduct a periodic inspection at intervals of approximately 6 months to use the product in its best condition.
  • Perform drainage regularly.
      If condensate enters the secondary side, it can cause operating failure of pneumatic equipment.

• **Assembly and disassembly the valve**
  • Before disassembling, shut down the power supply and air pressure supply, and release the residual pressure.
  • **Disassembly procedure**
      1. Remove the top mounting screws.
      2. Remove the solenoid coil, spring, and armature assembly.
      3. If there is any foreign matter adhering on the surface, take appropriate measures to clear it off such as an air blow or washing with neutral detergent.
  • **Assembly procedure**
      Reverse the above procedure to assemble the product.
      In case the electrical entry is changed, also change the mounting orientation of the solenoid coil before assembly.

  ∗: Tighten the 4 mounting screws by each pair of corners on a diagonal line at the proper tightening torque (0.4 to 0.5 Nm)

• **Precautions (Regulator AR Series)**
  • **Product handling**
    • **Installation**
      The adjustment knob must be handled manually. Use of tools may cause damage to the product.
      Check the inlet and outlet pressure indications on the pressure gauge while setting. If the knob is turned to excess, it may cause internal parts to fracture.
      Since products for 0.02 to 0.2 MPa settings come with a pressure gauge for 0.2 MPa, do not apply pressure exceeding 0.2 MPa. It may cause damage to the pressure gauge.
      Unlock the knob before pressure adjustment and lock it again when the adjustment is over.
      Incorrect procedure may cause damage to the knob or lead to the outlet pressure fluctuation.
    • Pull the adjustment knob to release the lock. An orange colored line is provided at the bottom of the adjustment handle for visual checking.
    • Push the pressure regulation knob to engage the lock. If it does not lock easily, turn the knob slightly clockwise or counterclockwise until the orange colored line goes out of sight.
    • When the product is installed, leave a space of 60 mm on the side of the valve guide (opposite to the knob) for maintenance and inspection.

</table>
Mounting and Installation

○ Manifold expansion

1. Disassemble

1. Loosen the screws and dismount two brackets one each front and back surface.
2. Split the switch slowly so as not to disengage the O-ring of the SUP port.

2. Insert

1. Set the expansion packing (ISA-7-B) in the concave of the SUP port for expansion switches.
2. Mount the convex of the expansion switch onto the existing switch.
3. Mount the two brackets (ISA-3-A) to their positions.
   ∗ Fasten the screws temporarily.
4. Make sure that an expansion packing is set in the concave of the existing switch SUP port.
5. Fit the convex of the existing switch onto the concave of the added switch.
6. Mount the existing bracket.
   ∗ Fasten the screws temporarily.

3. Tightening

1. Tightening the fasteners by specified torque 1.2 Nm.
2. Install air pipe and confirm that there is no air leakage from air pipe installed additionally

○ How to remove the end plate

It can remove by hooking a finger on the slot for removal on up-and-down, and pulling horizontally.
Circuit and wiring for Air Catch Sensor

- NPN open collector output
- PNP open collector output

Circuit and wiring for 2-port solenoid valve

- Without indicator lamp DC circuit
- Without indicator lamp AC circuit

Conduit terminal

Indicator lamp provided DC circuit

DIN connector

Indicator lamp provided AC circuit

See the catalog and operation manual of SMC VCA series for the wiring method of circuit and wiring for 2-port solenoid valve.
Do not apply incorrect power supply voltage to wiring. Incorrect power supply voltage may damage the equipment.
### Wiring

- **Discrete wiring method**
  1. Insert the lead wire attached with a connector into the key groove.
  2. Hold the knurled part by two fingers and turn it clockwise to tighten it. Stop tightening if two fingers become painful when tightening.
  3. Install wires of various colors coming out from the end of the cable. Install wires correctly while seeing the circuit diagram and the left table.

- **Concentrated wiring method**
  1. Mount the seal conduit on the terminal board box. See the catalog and operation manual of the seal conduit manufacturer for the method to mount the seal conduit.
  2. Insert the cable through the seal conduit and install the wires matching the polarities of the terminal board illustrated left.
  3. Tighten the seal conduit. Do not hold down the terminal board box or switch while tightening the seal conduit. Tightening torque shall be less than 5 Nm.
Setting

Set the detectable distance by the LED level meter and setting handle.
While setting, pull out the setting handle illustrated below.
Removing the hand off the setting handle will reset the setting handle condition before it is pulled out and the handle can no longer be turned.

1. Apply a thickness gauge onto the detection nozzle and set a setting state for accurate setting.
2. Confirm that supply pressure is applied. If the setting handle is fully closed, the LED will light off.
3. Pull the setting handle and turn in the plus direction will light up in this order.
4. When the LED on the LED level meter lights up, the sensor output turns ON. Finish setting when lights up.
5. Apply a thickness gauge again and check that lights up.

Handling and setting of 2-port solenoid valve

Throttle setting for blowing to prevent water, cutting fluid or other liquid from entering the nozzle.
Clockwise: Throttle close
Counterclockwise: Throttle open
*: The setting is not required if the valve of your sensor does not have a throttle.

1. Turn the power of the value off.
2. Adjust the throttle turning clockwise so that water, cutting fluid or other liquid is not flung up from the detection nozzle.
3. Turn the power of the valve on, then turn the power OFF again. Confirm that water, cutting fluid or other liquid is not flung up from the detection nozzle.
*: Do not rotate more than 5 times from fully closed condition since the orifices is pulled out.
- Manual operation
  Slotted locking type (Tool required)
  Valve opening: Turn the screw 90 clockwise using a slotted screwdriver. The valve remains open even when the screwdriver is removed.
  Valve closing: Turn the screw 90 anticlockwise from a valve open position to its original position.

  Make sure that the screw is in a valve closed position in case of electric operation.

- Handling and setting of limit gauge indicator
  1. Cover Dismounting
     Hold the edge of the front cover by fingers and turn the cover in the OPEN arrow direction till it stops (15°). Pull the cover in front direction to dismount it.

  2. Installing referential Needles
     Move an referential needle by a fingertip. Adjust high and low limits of pressure by two green referential needles.

  3. Cover Mounting
     After finishing setting the referential needles, mount the cover back to its original position. Insert the cover pin into the hole in the case (mark ▲ in enlarged view of part A) and turn it clockwise till it stops. (Direction opposite the OPEN arrow direction) Confirm that the cover is hold securely.
Designing data

- Nozzle diameter and detection distance
  
The graphs below show the hysteresis in relationship to the detection distance. When high accuracy is required, design the system so the hysteresis is within the 0.01 mm detection distance. When the Hysteresis exceeds 0.01 mm use the Air Catch Sensor as a confirmation of position of work piece.

ISE2-G □ □ □

- Detection nozzle: φ1.0
- Detection piping: φ6 × 4 tubing 5 m

ISE2-H □ □ □

- Detection nozzle: φ1.0
- Detection piping: φ6 × 4 tubing 5 m
○Response time
The response time is dependent on the detection distance and the piping length.
The above figures show the response time for different detection distance settings and a constant piping length. The below figures show the response time when the detection distance is constant but the piping length changes. As can be seen from the graphs below, if the piping length is kept short and the detection distance is small, the response time is faster.

ISE2-G
Detection nozzle: 4\,\text{mm}
Piping: 6\times 4\,\text{tubing 5m}
Supply pressure: 100\,\text{kPa}

Detection distance vs. response time

Detection distance (mm)

Response time (sec)

0.05 mm
0.1 mm
0.15 mm
0.25 mm

0 0.05 0.1 0.15 0.2 0.25 0.3

ISE2-H
Detection nozzle: 2\,\text{mm}
Piping: 6\times 4\,\text{tubing 5 m}
Supply pressure: 100\,\text{kPa}

Detection distance vs. response time

Detection distance (mm)

Response time (sec)

0.05 mm 0.1 mm 0.15 mm 0.3 mm 0.5 mm

0 0.1 0.2 0.3 0.4 0.5 0.6

ISA2-H
Detection nozzle: 1\,\text{mm}
Piping: 6\times 4\,\text{tubing 5 m}
Supply pressure: 100\,\text{kPa}
Detection distance: 0.15\,\text{mm}

Response time vs. piping length

Piping length

Response time (sec)

0.5 0.6 0.7 0.8 0.9 1.0

0 0.02 0.04 0.06 0.08 0.1 0.12 0.14 0.16

Response time vs. piping length

Piping length

0.5 0.6 0.7 0.8 0.9 1.0

0 0.02 0.04 0.06 0.08 0.1 0.12 0.14 0.16
The graphs below show the detection distance for different supply pressure settings.

**ISE2-G**
- Detection nozzle: 4.1.0
- Detection piping: 6 × 4 tubing 5 m

**ISA2-H**
- Detection nozzle: 4.1.0
- Detection piping: 6 × 4 tubing 5 m

---

Supply pressure vs. detection distance
Troubleshooting

Applicable Pressure switch: ISA2

If a cause applicable to the failure cannot be identified and normal operation can be recovered by replacement with a new Pressure switch, this indicates that the Pressure switch itself was broken. The Pressure switch breakage can be caused by operating environment (network construction, etc.), and so consult with SMC separately to obtain countermeasures.
